To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)

Send any inquiries to http://www.renesas.com/inquiry.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

Cautions

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
   Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
   The information described here may contain technical inaccuracies or typographical errors.
   Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
   Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (http://www.renesas.com).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
   Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.

Precautions for Safety

Definitions of Signal Words

In both the user's manual and on the product itself, several icons are used to insure proper handling of this product and also to prevent injuries to you or other persons, or damage to your properties.
This chapter describes the precautions which should be taken in order to use this product safely and properly. Be sure to read this chapter before using this product.

⚠	This symbol represents a warning about safety. It is used to arouse caution about a potential danger that will possibly inflict an injury on persons. To avoid a possible injury or death, please be sure to observe the safety message that follows this symbol.
⚠ **DANGER**	**DANGER** indicates an imminently dangerous situation that will cause death or heavy wound unless it is avoided. However, there are no instances of such danger for the product presented in this manual.
⚠ **WARNING**	**WARNING** indicates a potentially dangerous situation that will cause death or heavy wound unless it is avoided.
⚠ **CAUTION**	**CAUTION** indicates a potentially dangerous situation that will cause a slight injury or a medium-degree injury unless it is avoided.
CAUTION	**CAUTION** with no safety warning symbols attached indicates a potentially dangerous situation that will cause property damage unless it is avoided.
IMPORTANT	This is used in operation procedures or explanatory descriptions to convey exceptional conditions or cautions to the user.

In addition to the five above, the following are also used as appropriate.

△means WARNING or CAUTION.
Example:  CAUTION AGAINST AN ELECTRIC SHOCK

⃠means PROHIBITION.
Example:  DISASSEMBLY PROHIBITED

●means A FORCIBLE ACTION.
Example:  UNPLUG THE POWER CABLE FROM THE RECEPTACLE.

⚠ WARNING

Warnings for AC Power Supply:

- If the attached AC power cable does not fit the receptacle, do not alter the AC power cable and do not plug it forcibly. Failure to comply may cause electric shock and/or fire.
- Use an AC power cable which complies with the safety standard of the country.
- Do not touch the plug of the AC power cable when your hands are wet. This may cause electric shock.
- This product is connected signal ground with frame ground. If your developing product is transformless (not having isolation transformer of AC power), this may cause electric shock. Also, this may give an unrepairable damage to this product and your developing one.
  While developing, connect AC power of the product to commercial power through isolation transformer in order to avoid these dangers.
- If other equipment is connected to the same branch circuit, care should be taken not to overload the circuit.

- When installing this equipment, insure that a reliable ground connection is maintained.

- If you smell a strange odor, hear an unusual sound, or see smoke coming from this product, then disconnect power immediately by unplugging the AC power cable from the outlet.
  Do not use this as it is because of the danger of electric shock and/or fire. In this case, contact your local distributor.
- Before setting up this product and connecting it to other devices, turn off power or remove a power cable to prevent injury or product damage.

Warnings to Be Taken for This Product:

- Do not disassemble or modify this product. Personal injury due to electric shock may occur if this product is disassembled and modified. Disassembling and modifying the product will void your warranty.
- Make sure nothing falls into the cooling fan on the top panel, especially liquids, metal objects, or anything combustible.

Warning for Installation:

- Do not set this product in water or areas of high humidity. Make sure that the product does not get wet. Spilling water or some other liquid into the product may cause unrepairable damage.

Warning for Use Environment:

- This equipment is to be used in an environment with a maximum ambient temperature of 35°C. Care should be taken that this temperature is not exceeded.

⚠ CAUTION
Note on Connecting the Power Supply: ● The power cable included with the product has its positive and negative poles color-coded by red and black, respectively. ● Pay attention to the polarities of the power supply. If its positive and negative poles are connected in reverse, the internal circuit may be broken. ● Do not apply any voltages exceeding the product's rated power supply voltage (5.0 V ±5%). Extreme voltages may cause a burn due to abnormal heat or cause the internal circuit to break down.
Cautions to Be Taken for Handling This Product: ● Use caution when handling the main unit. Be careful not to apply a mechanical shock. ● Do not touch the connector pins of the product main unit and the target MCU connector pins directly. Static electricity may damage the internal circuits. ● Excessive flexing or force of the flexible cable for connecting this product to the emulation probe may break connector.
Cautions to Be Taken for System Malfunctions: ● If the product malfunctions because of interference like external noise, do the following to remedy the trouble. (1) Press the RESET button on the board. (2) If normal operation is not restored after step (1), shut OFF the product once and then reactivate it.

Content

1. Outline

This chapter describes the package components, the system configuration and the preparation for using this product for the first time.

1.1 Package Components

The R0P7760TH003TRKE package consists of the following items.

Table 1.1 Package components

Item	Quantity
T-Engine Board	1
ACadapter	1
RS-232C cable	1
CD-ROM - T-Engine Board User's Manual (This Manual) - T-Kernel and other software and various documentation (Personal Media Corporation)	1

1.2 System Configuration

1.2.1 T-Engine Features

The following summarizes the main features of T-Engine.

(1) The manual covers all information about T-Engine, including the circuit diagrams, connector specifications, and internal logic of FPGA employed on this board.

(2) The peripheral LSI chips (PCMCIA controller and sound generator chips) are commercially available.

(3) This board contains the PCMCIA controller, sound generator chip, SIM card connector, etc., so that application systems can be developed taking advantage of them.

(4) This board contains two SH7760 buses (address bus and data bus) and one expansion slot subject to control signal output so that users can connect user-specific hardware.

1.2.2 T-Engine Configuration

Figure 1.1 shows a T-Engine Board system configuration and Figure 1.2 shows a T-Engine block diagram. Users must prepare any user-specific devices as needed, in addition to preparing the T-Engine and its accessories.

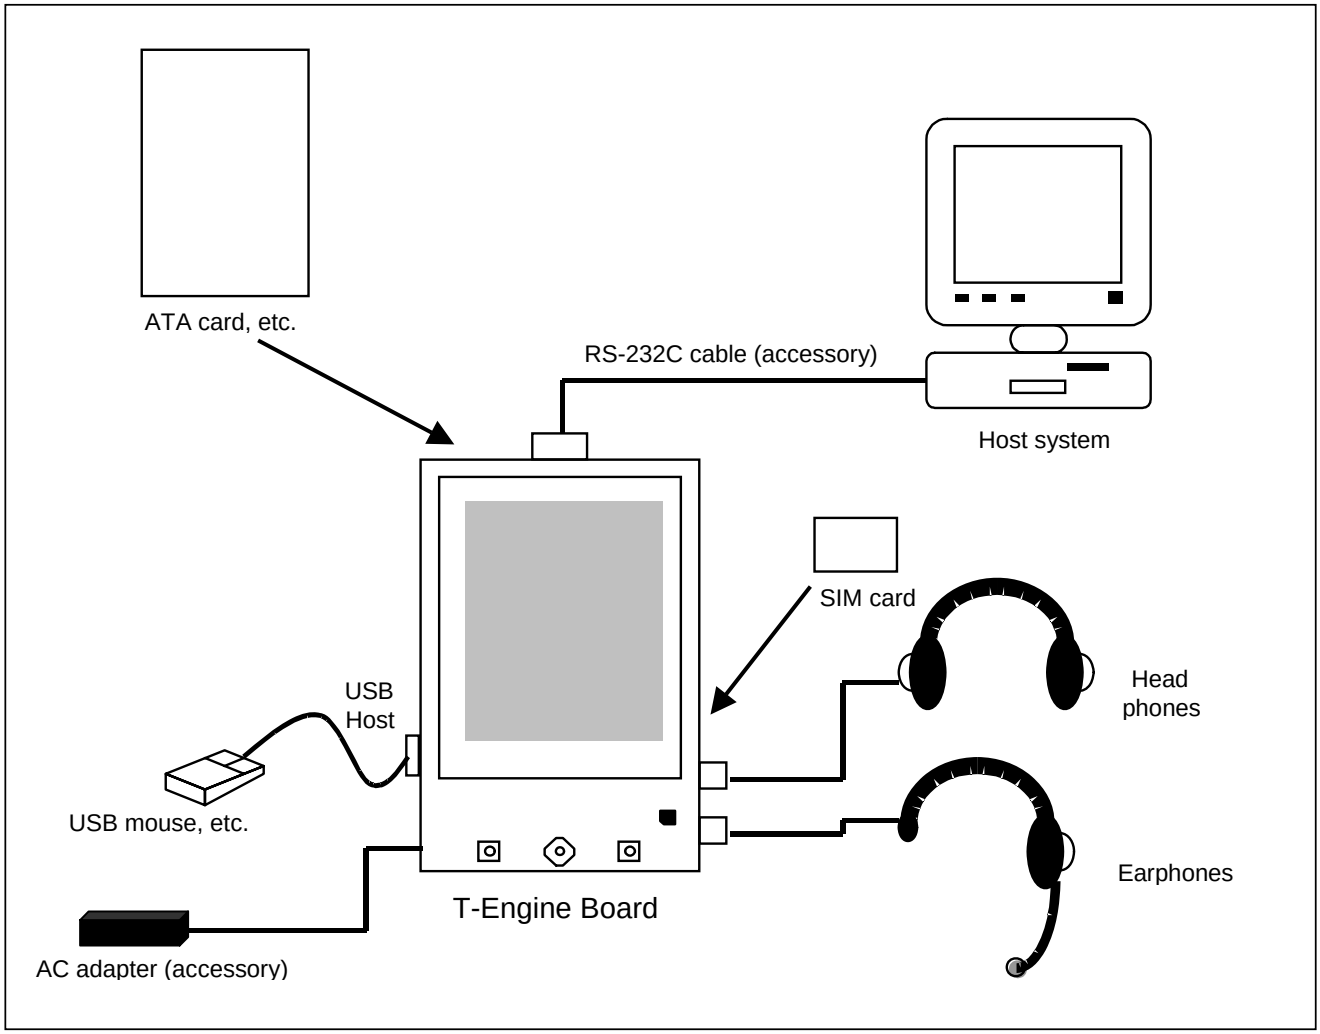

Figure 1.1 System configuration

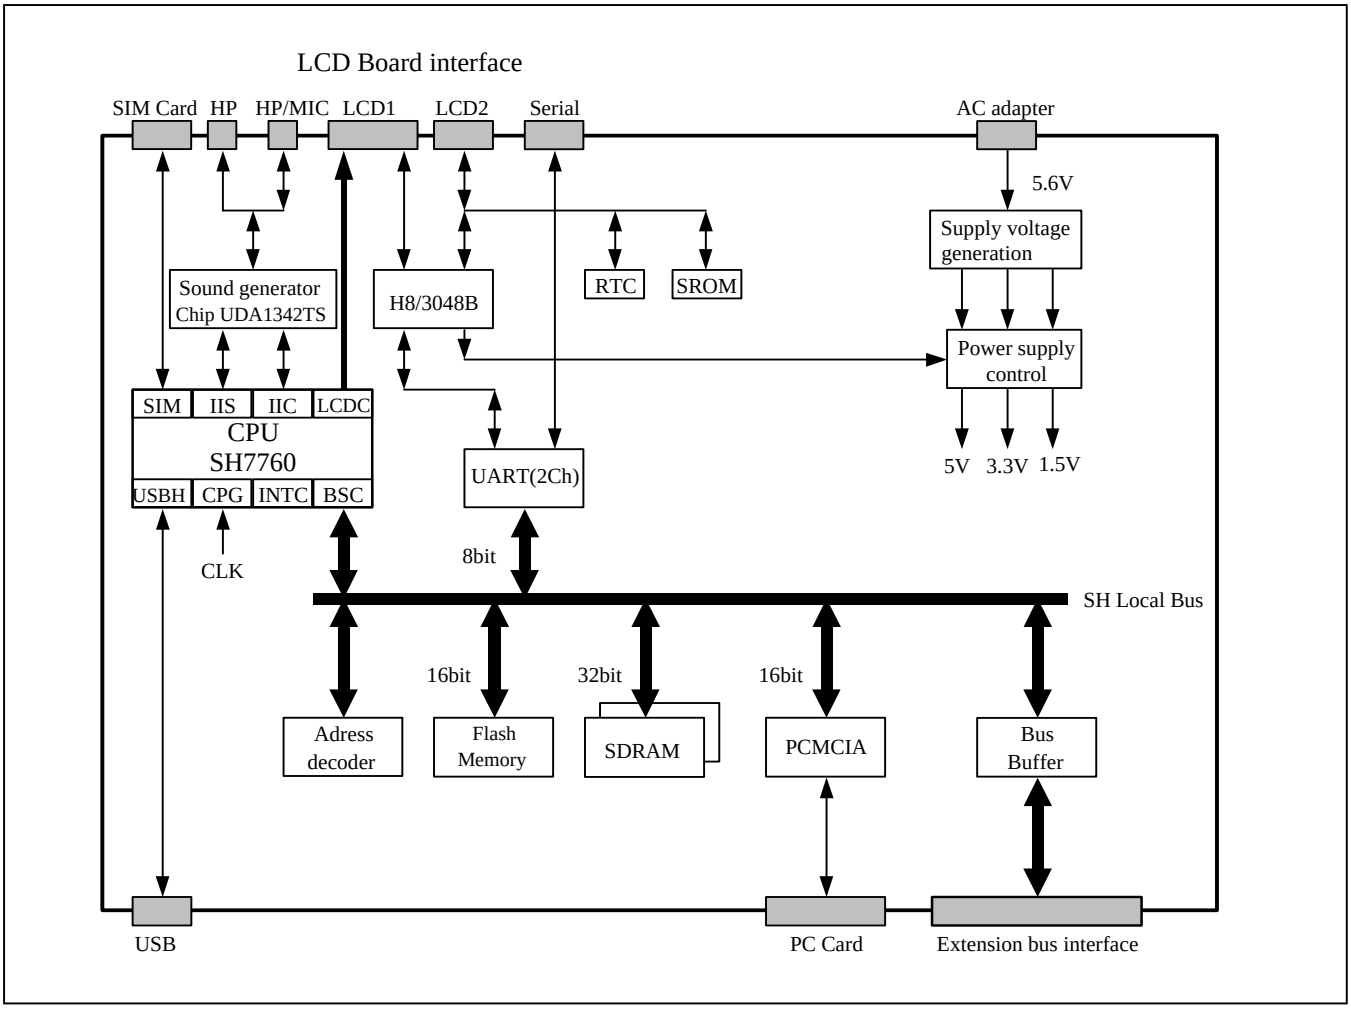

Figure 1.2 T-Engine Block Diagram

1.3 T-Engine Appearance

T-Engine Board consists of four boards: CPU, LCD, debug, and I/O boards. Figure 1.3 is an external view of the T-Engine. Figures 1.4 to 1.7 show the appearances of the respective boards (LCD, CPU, debug, and I/O boards).

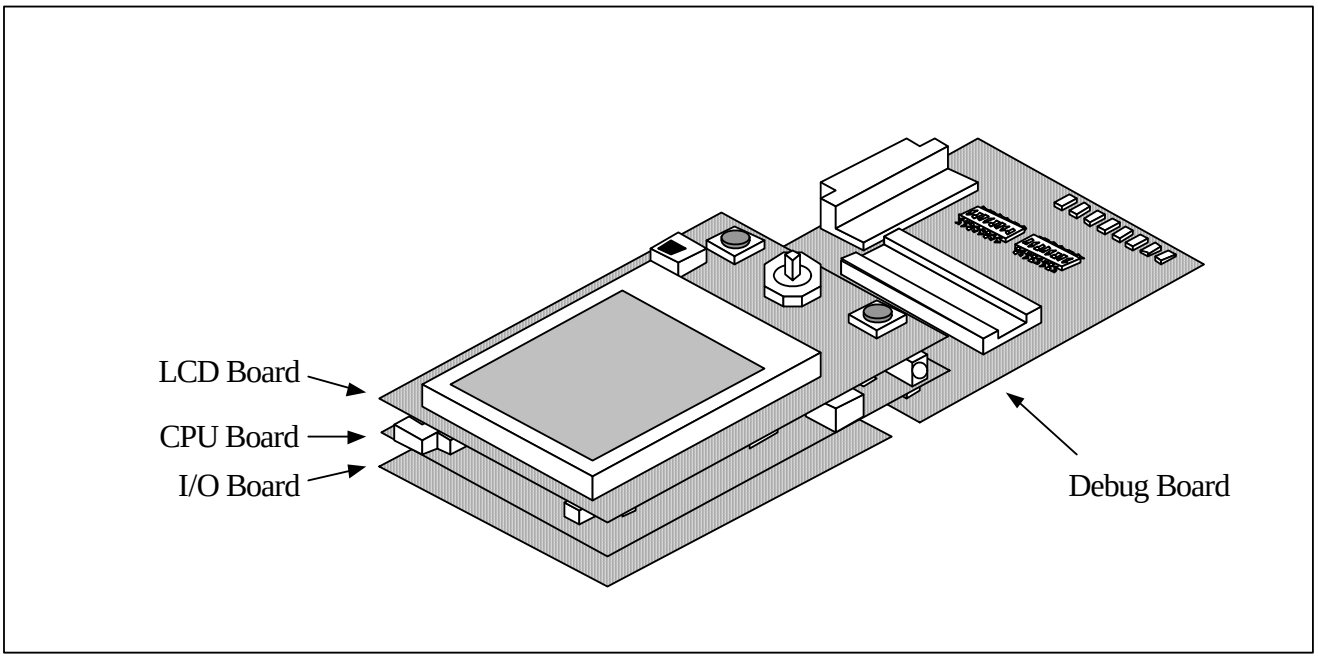

Figure 1.3 T-Engine - External View

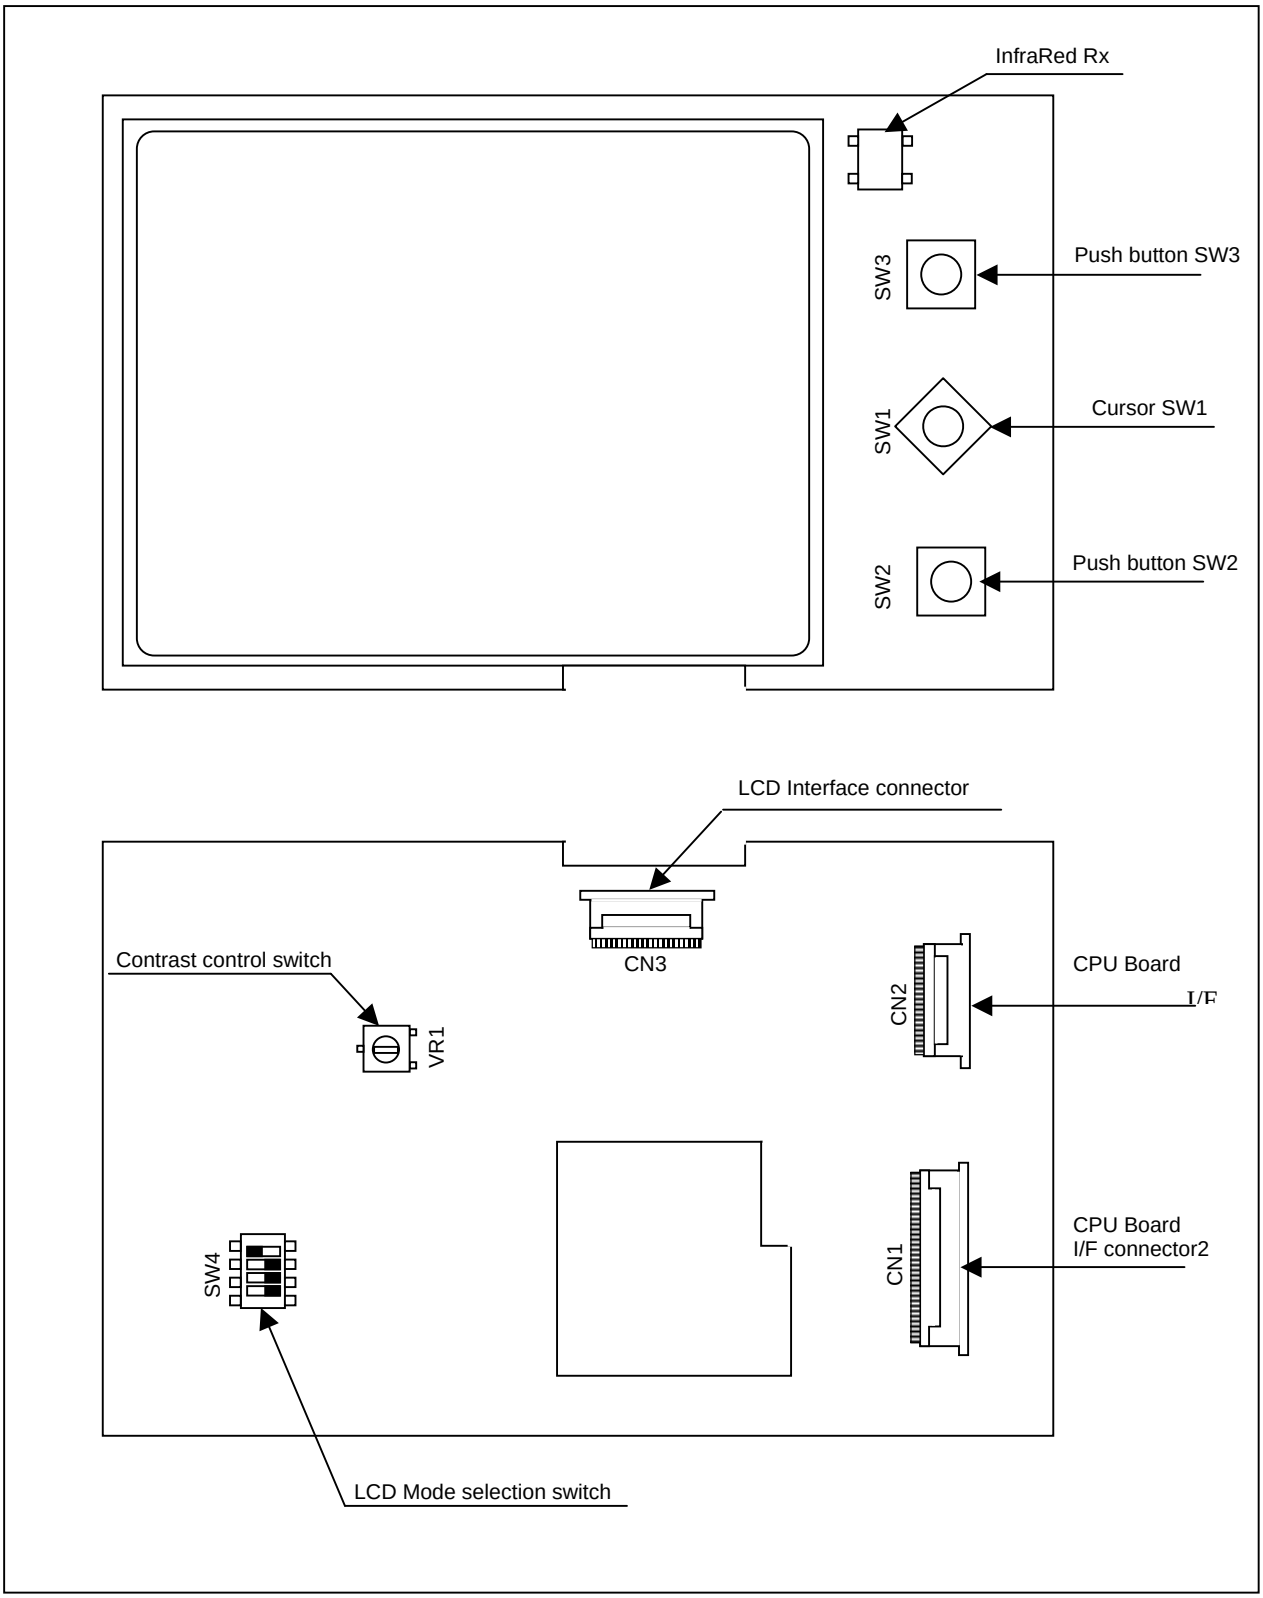

Figure 1.4 LCD Board - External View

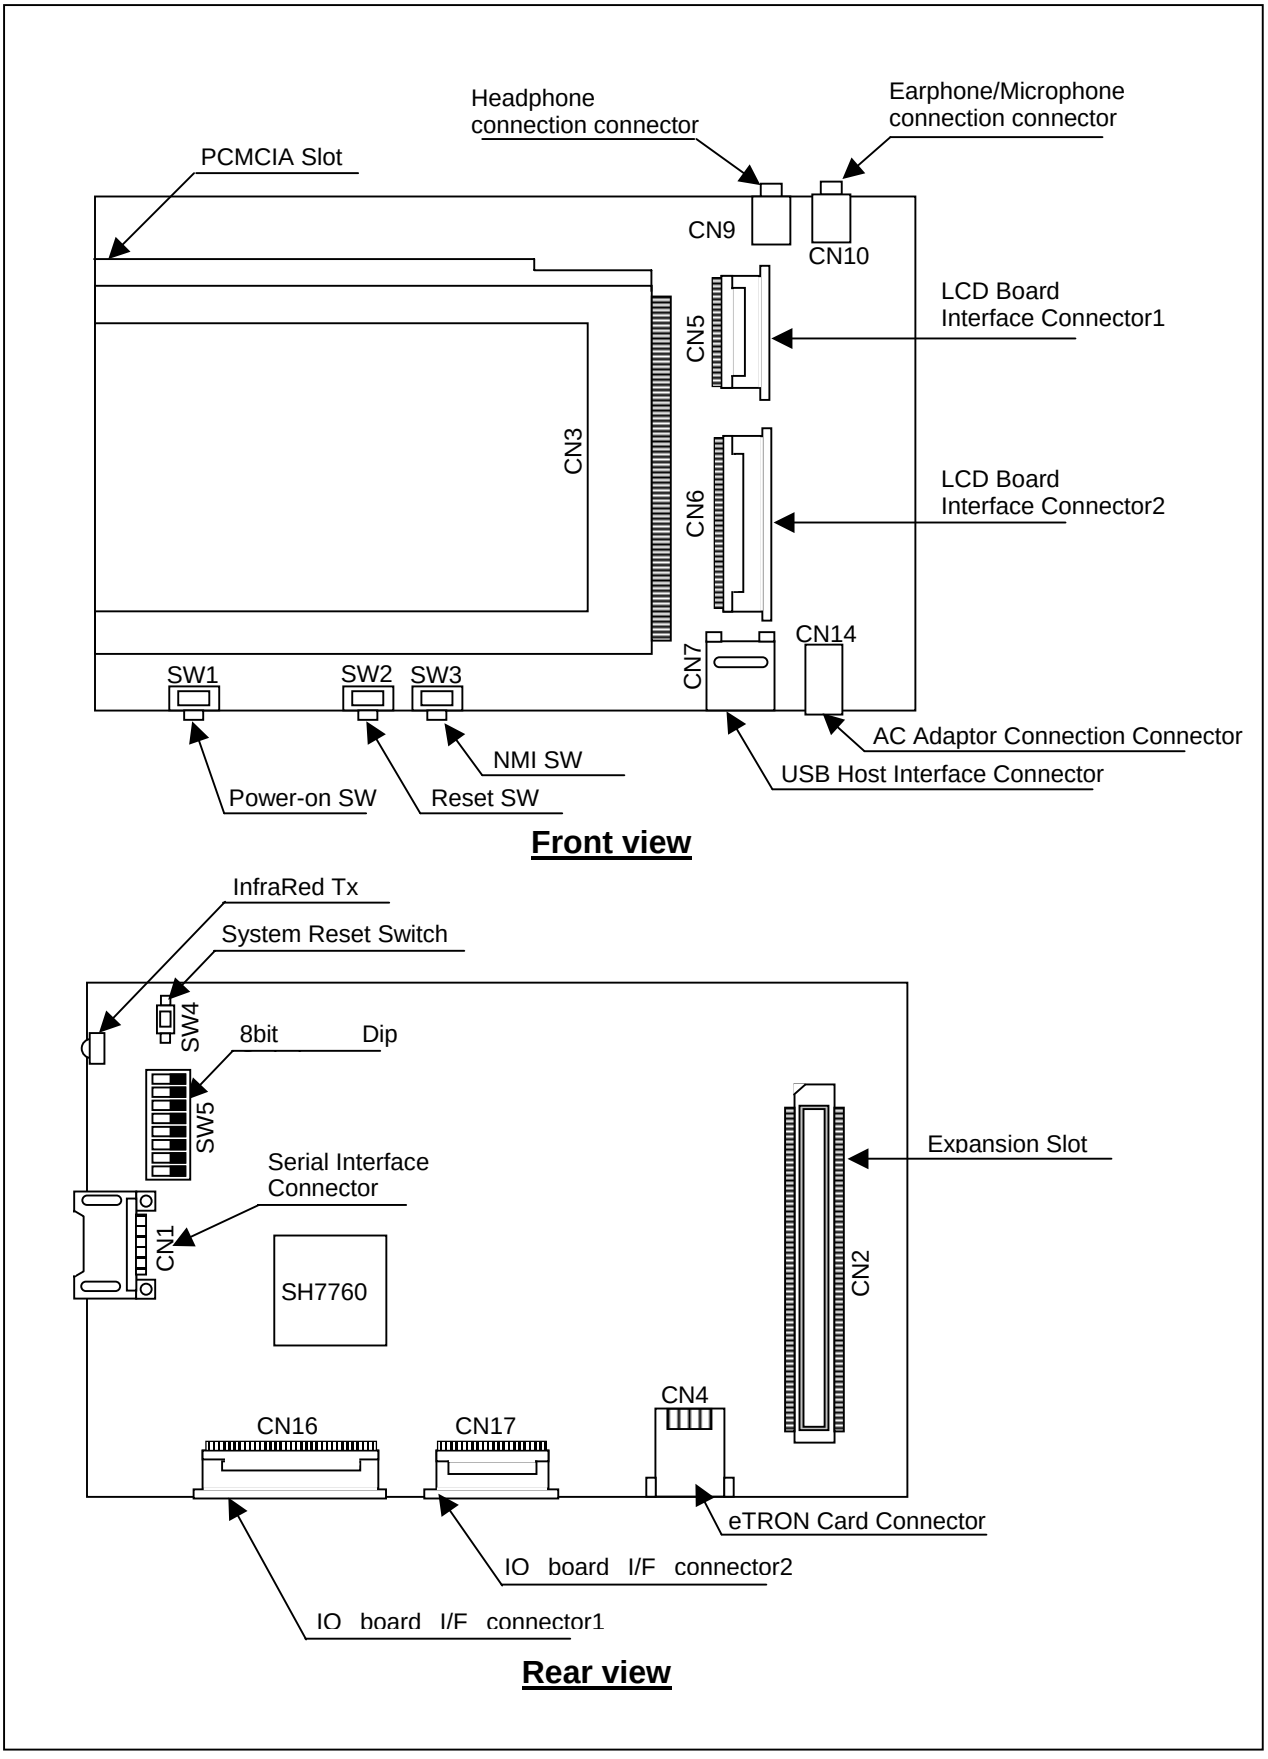

Figure 1.5 CPU Board - External View

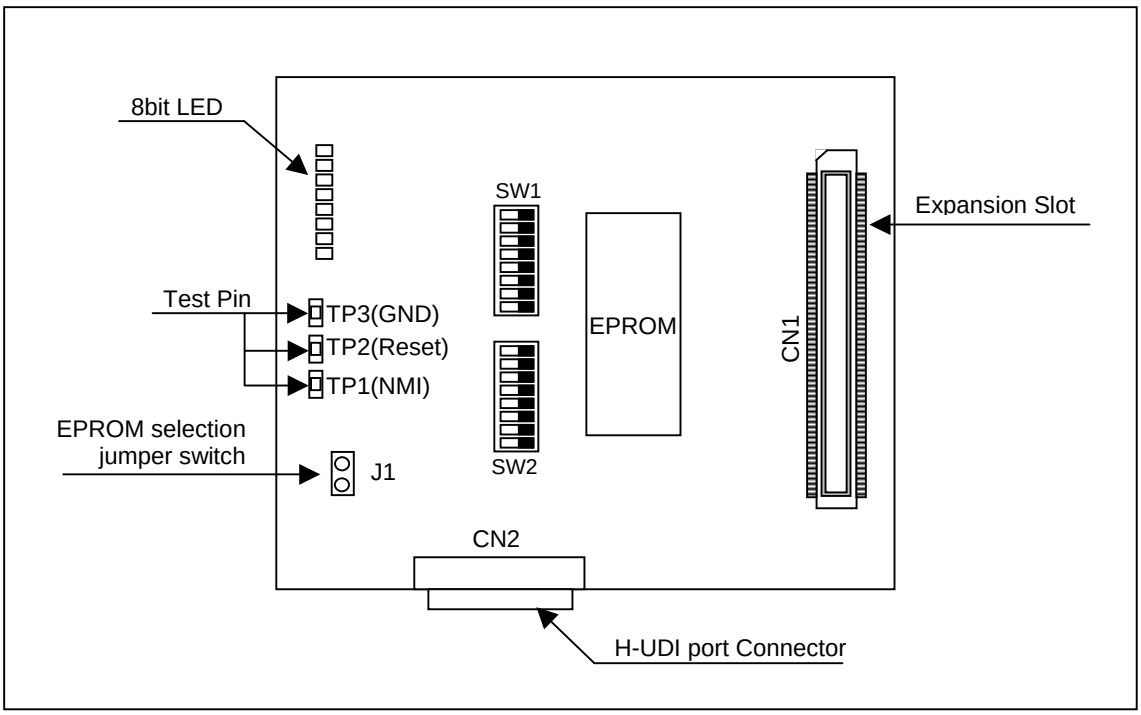

Figure 1.6 Debug Board - External View

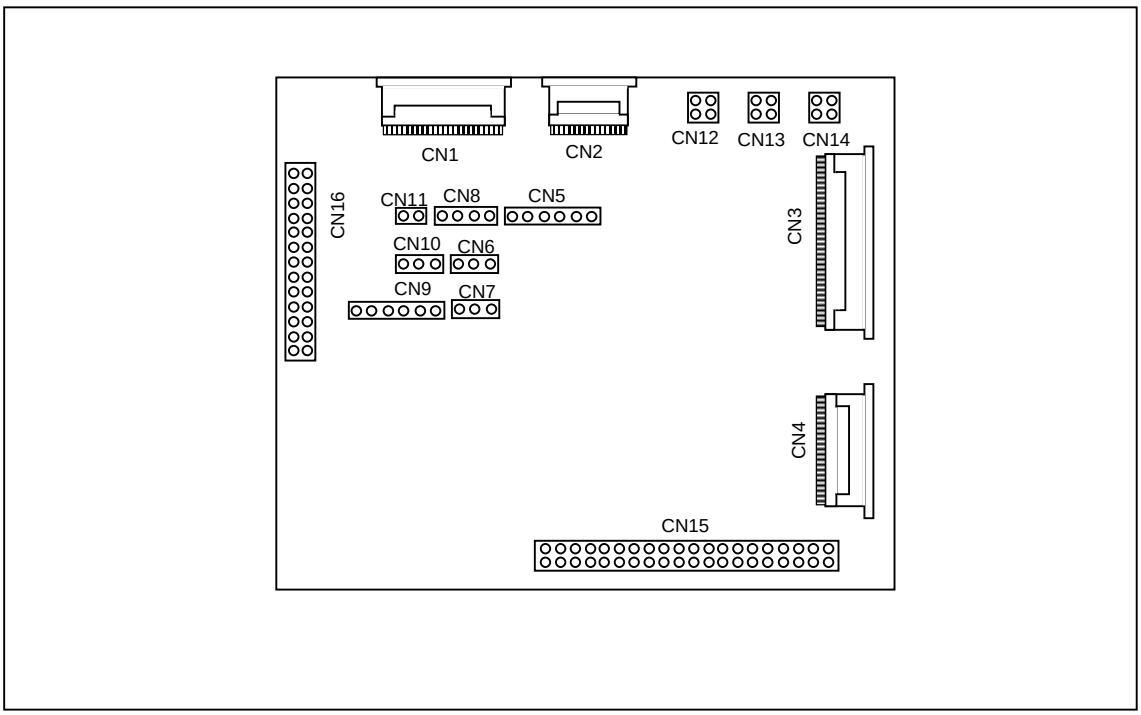

Figure 1.7 I/O Board - External View

1.4 T-Engine Specifications

Table 1-1 summarizes the T-Engine function specifications and Table 1-2 the power supply, dimensions, and environmental specifications.

Table 1-1 T-Engine Function Specifications

Item	Specifications	Target device
CPU	SH7760 Model name: HD6417760BP200DV (RENESAS Technology) Input clock: 16.6667MHz Operating clock (CPU clock): 200MHz (x 12) (bus clock): 66MHz (x 4) (peripheral clock): 33MHz (x 2)	Clock mode = 3 MODE[2,1,0] = 011
Flash memory	Capacity: 8MB S29JL064H70TFI000(Spansion) x 1	
SDRAM	Capacity: 64MB MT48LC16M16A2P-75(Micron) x 2	
PC Card I/F	One slot MR-SHPC-01 V2T-F (Marubun)	
Serial I/F	2ch XR16L2550IM-F (EXAR)	ChA: H8/3048F-ONE I/F ChB: Monitor for debugging
Sound	UDA1342TS/N1(Philips) Earphone/microphone: 1ch Headphone output: 1ch - Microphone input Impedance: 2.2KΩ Sensitivity: -51dB/Pa - Headphone output Impedance: 32Ω	The SH7760 on-chip SSI is used to transmit data. The SH7760 on-chip IIC is used to select the mode.
USB Host	1ch SH7760 on-chip USB Host	
TFT color LCD module	LS037V7DW01(SHARP) Display color: 262,144 colors Display area: 240(H) x 320(V) Controller:SH7760 on-chip LCDC Touch panel controller:ADS7843E(TI)	
Power supply controller	H8/3048F-ONE Model name: HD64F3048BVTE25V (Renesas Technology) Operating frequency: 7.3728MHz	The control SH7760 working for power supply control, RTC, or tablet interface infrared remote control must be interfaced via the serial chA.
RTC	Model name: RV5C348B<E2>-F(RICOH)	Via the H8/3048F-ONE
Serial EEPROM	Capacity: 512 bytes BR93L66FJ-W(ROHM)	Via the H8/3048F-ONE
Infrared remote control	Transmission Model name: GL390(SHARP) Reception Model name: GP1US301XP(SHARP) Transmission carrier: 38KHz	Via theH8/3048F-ONE

Table 1.2 Power supply, Dimensions, and Environmental Specifications of the T-Engine Board

Item	Specifications
Environment	Operating conditions - Temperature: 10-35ºC - Humidity: 30 to 85% RH (no dew condensation occurs) Ambient gas: no corrosive gas
Operating voltage	DC 5.6VDC
Dissipation current	500mA
Dimensions	CPU board: 120mm x 75mm LCD board: 120mm x 75mm Debug board: 101mm x 75mm I/O board: 101mm x 75mm

Table 1.3 Permissible Current Supplied Externally by T-Engine Supply Voltage

Supply voltage	Permissible current	Locations subject to current supply
5V	250mA	• PCMCIA card power supply • USB bus power • Expansion slot
3.3V	250mA	• PCMCIA card power supply • Expansion slot

⚠ CAUTION

- Table 1.2 shows the maximum dissipation current of T-Engine (comprising only the CPU board, LCD board, debug board, and I/O board) without external devices.
- Table 1.3 shows the sum of permissible current in all the powered devices on T-Engine. Accordingly, when a current of 100mA is used for the PCMCIA card supply voltage (5V), the currents of the USB bus power or extension slot is 150mA (250mA to 100mA). This is true for the supply voltage 3.3V.
- When the PCMCIA card, etc. is powered from the internal power supply of T-Engine, the current must not exceed the permissible current of each power supply shown in Table 1.3. Otherwise, there is a risk of electric shock, heat, or fire.

2. Installation

2.1 Host System Connection

To use T-monitor, connect the serial interface connector (CN1) of the T-Engine board with an RS-232C interface cable (accessory). Figure 2.1 shows the host system connection method. Figure 2.2 shows the pins of the serial interface connector. Table 2.1 shows the signals of the serial interface connector.

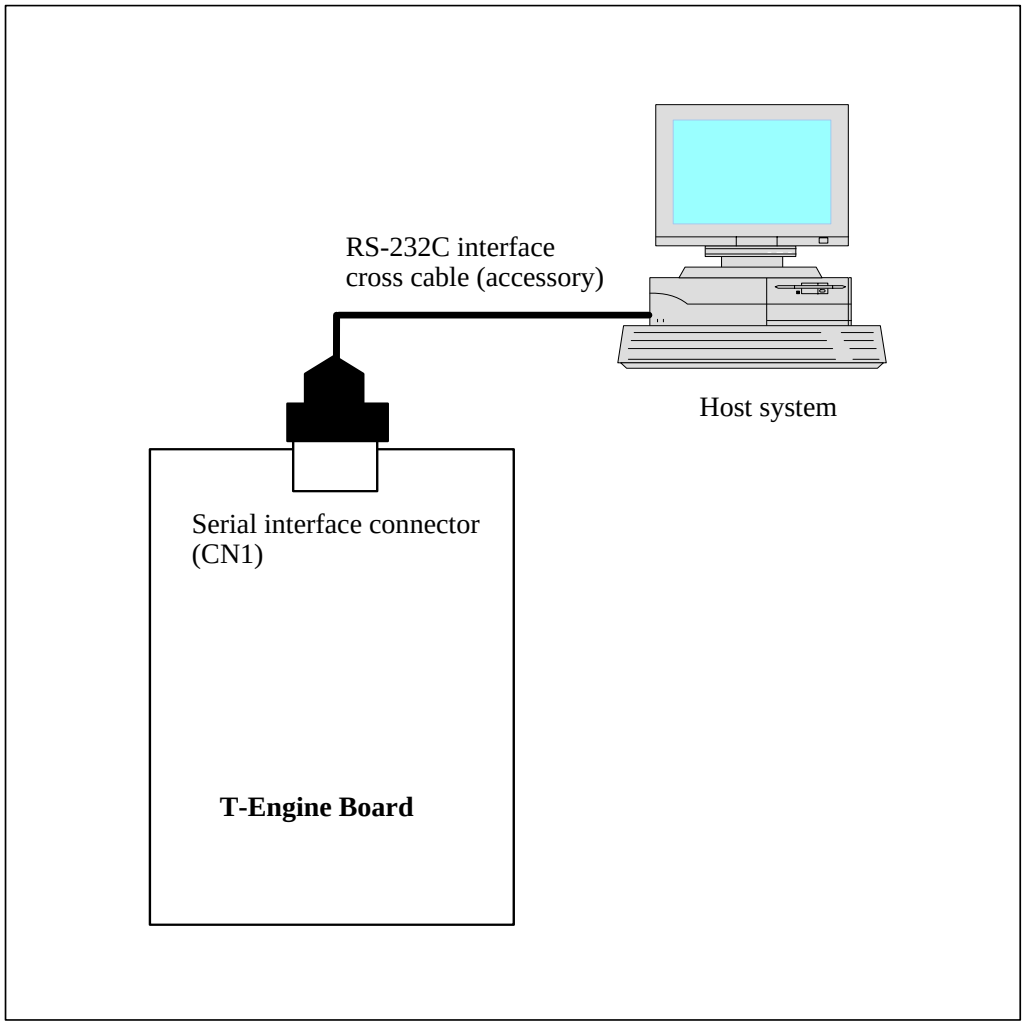

Figure 2.1 Host System Connection

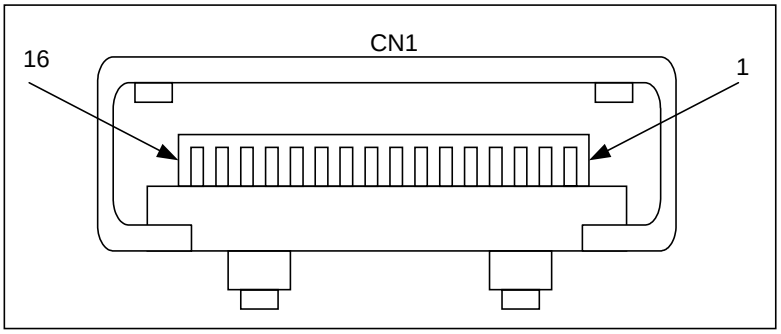

Figure 2.2 Serial Interface Connector Pins

Table 2.1 Serial Interface Connector Signals

Pin No.	Signal name	I/O	Remarks
1	GND	-	
2	TxD	Output	TXB(UART)
3	RxD	I	RXB(UART)
4	GND	-	
5	RTS	O	RTSB(UART)
6	CTS	I	CTSB(UART)
7	GND	-	
8	Reserved	-	
9	Reserved	-	
10	Reserved	-	
11	Reserved	-	
12	Reserved	-	
13	Reserved	-	
14	Reserved	-	
15	Reserved	-	
16	Reserved	-	

2.2 AC Adapter Connection

Figure 2.3 shows an AC adapter connection method. As shown in Figure 2.3, connect the plug to the AC adapter connector of the T-Engine board (1), then connect the adapter cord to the receptacle (2).

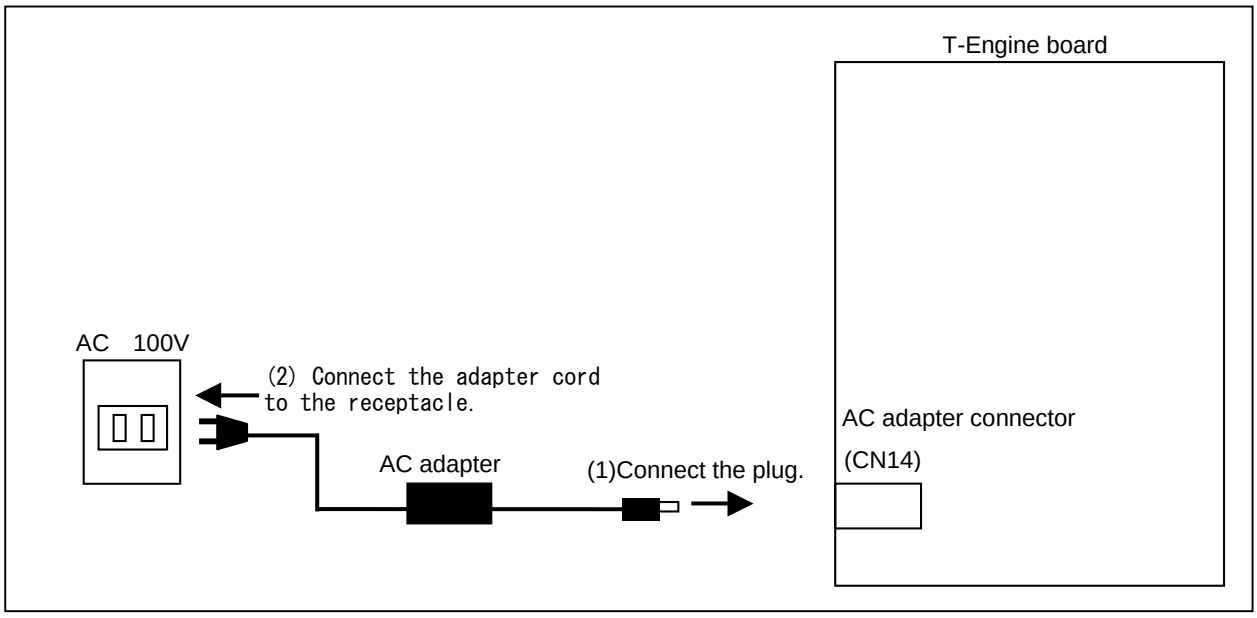

Figure 2.3 AC Adapter Connection Cord

⚠ CAUTION

- Don't put heavy things on the AC adapter cord. To avoid the risk of electric leakage, fire, or electric shock, don't damage or modify the AC adapter cord.
- To avoid the risk of electric shock, don't unplug the AC adapter cord with wet hands. To avoid the risk of cord damage, electric shock, or fire, don't pull on the AC adapter cord; rather, grasp and pull the plug to disconnect the AC adapter cord.
- When connecting the AC adapter to the receptacle, check the polarity and connection beforehand to avoid the risk of electric shock, fire, or fault.

2.3 Turning ON or OFF the T-Engine Board

To turn the T-Engine board ON or OFF, press the power-on switch (SW1) on the CPU board. To turn ON the T-Engine board, press and hold the switch for 0.5 seconds or more. To turn it OFF, press and hold this switch for 2 seconds or more while the T-Engine board is powered.

2.4 Using the Debug Board

2.4.1 Debug Board Function

When the debug board has been connected to the T-Engine, the following functions can be implemented:

(1) Run the program stored in the EPROM on the debug board to refresh the flash memory on the T-Engine board. For details on flash memory refresh, refer to 10. “Flash Memory Refresh.”

(2) The 8-bit LEDs on the debug board can be turned on or off from the SH7760. The software execution state can be monitored by controlling the ON/OFF state of these LEDs.

(3) The 16-bit SWs on the debug board can be read from the SH7760. Various operating conditions can be controlled through these SWs.

(4) The OCD (On-chip debugging) emulator (to be connected to the H-UDI and AUD pins of the SH7760) can be used.

2.4.2 Debug Board Connection

Figure 2.4 shows a debug board connection method. Connect the debug board to the extension slot (CN2) on the T-Engine board.

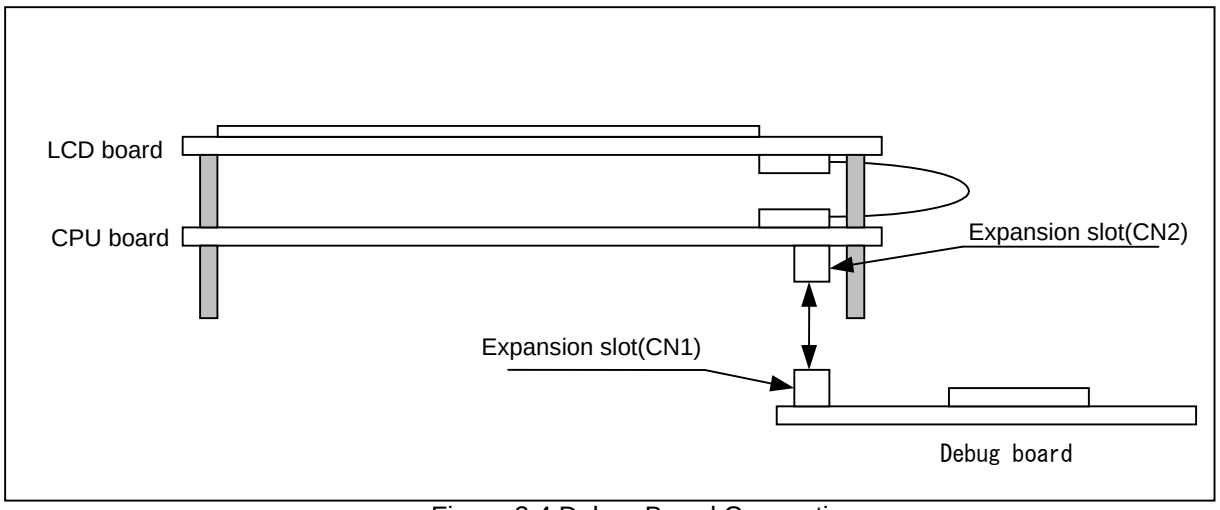

Figure 2.4 Debug Board Connection

⚠ CAUTION

Turn off the T-Engine before connecting the debug board or detaching the EPROM. When reattaching the EPROM, check the connecting direction as shown in Figure 2.5.

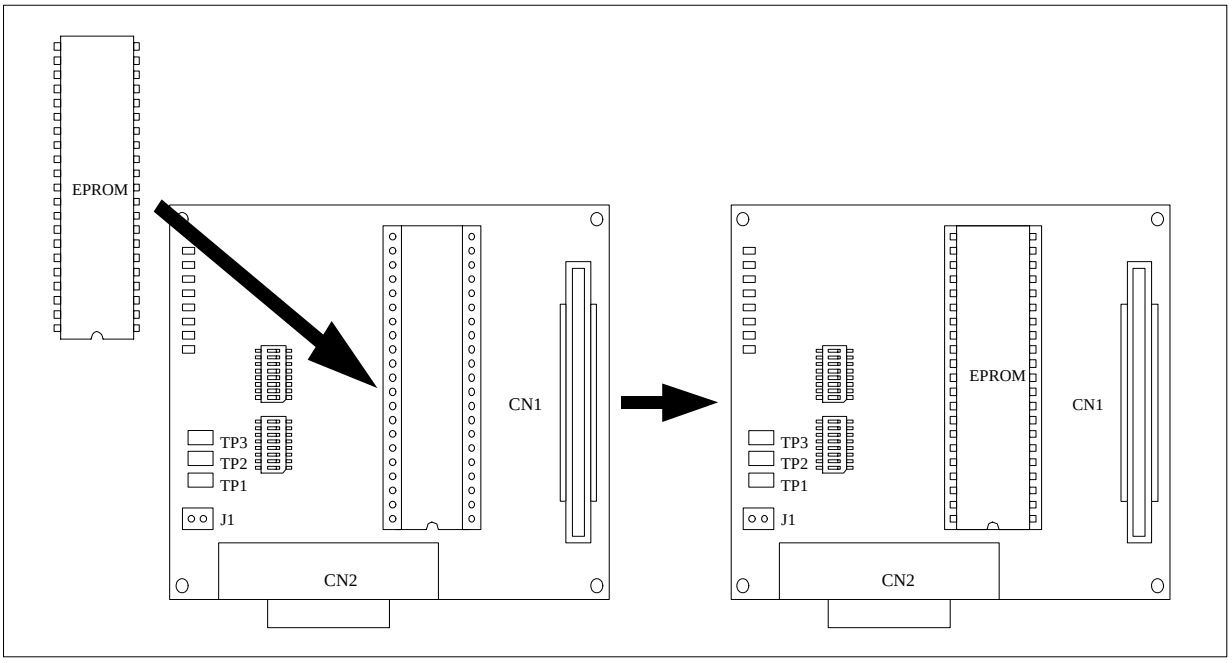

Figure 2.5 EPROM Connection

2.4.3 Debug Board Jumper Switches

Table 2.2 describes a method for setting the EPROM selection jumper switch (J1) on the debugger board. For details of a memory map during debug board connection, refer to 4. “Memory Map.”

Table 2.2 Setting the EPROM Selection Jumper Switch (J1)

Jumper switch	Setting	Description
J1	 Pins 1 and 2 must be open	Debug board resources are assigned to area 0 on the SH7760 board as shown below. (Factory setting) - The flash memory on the T-Engine board is assigned to an address range from h’00000000 to h’007FFFFF. - The EPROM mounted on the debug board is assigned to an address range from h’01000000 to h’013FFFFF. - The 8-bit LEDs mounted on the debug board are assigned to an address range from h’014000000 to h’017FFFFF. - The 16-bit SWs mounted on the debug board are assigned to an address range from h’01800000 to h’01FFFFFF.
	 Pins 1 and 2 must be short-circuited.	Debug board resources are assigned to area 0 on the SH7760 board as shown below. - The EPROM mounted on the debug board is assigned to an address range from h’00000000 to h’003FFFFF. - The 8-bit LEDs mounted on the debug board are assigned to an address range from h’00400000 to h’007FFFFF. - The 16-bit SWs mounted on the debug board are assigned to an address range from h’00800000 to h’00FFFFFF. - The flash memory on the T-Engine board is assigned to an address range from h’01000000 to h’017FFFFF.

2.4.4 8-bit LEDs on the Debug Board

The low-order 8 bits (D7 to D0) of the SH7760 data bus are connected to the 8-bit LEDs placed on the debug board. The 8-bit LEDs can be turned on or off by writing data to an area assigned for the LEDs through D7 to D0. When a value of 1 is written to a bit, the corresponding LED is turned off. When a value of 0 is written to the bit, it is turned on.

2.4.5 16-bit SWs on the Debug Board

The 16 bits (D15 to D0) of the SH7760 are connected to the 16-bit SWs placed on the debug board. The 16-bit SWs can be turned on or off by reading data from an area assigned for the SWs through D15 to D0. When a value of 1 is read from a bit, the corresponding SW is turned off. When a value of 0 is read from the bit, the corresponding SW is turned on.

2.4.6 OCD emulator Connection

The debug board allows the OCD emulator to be connected to the pin 36 (CN2) connector. Connect the H-UDI and AUD pins of the SH7760 board to the CN2. Figure 2. 6 shows a method for connecting the OCD emulator. Connect an OCD emulator cable to the CN2 of the debug board. Note that the following OCD emulator can be connected to T-Engine. For details on the OCD emulator connection/setup procedure, refer to the pertinent manual of the product.

- Renesas Technology Corporation

  E10A-USB Emulator Model name: HS0005KCU02H (AUD)

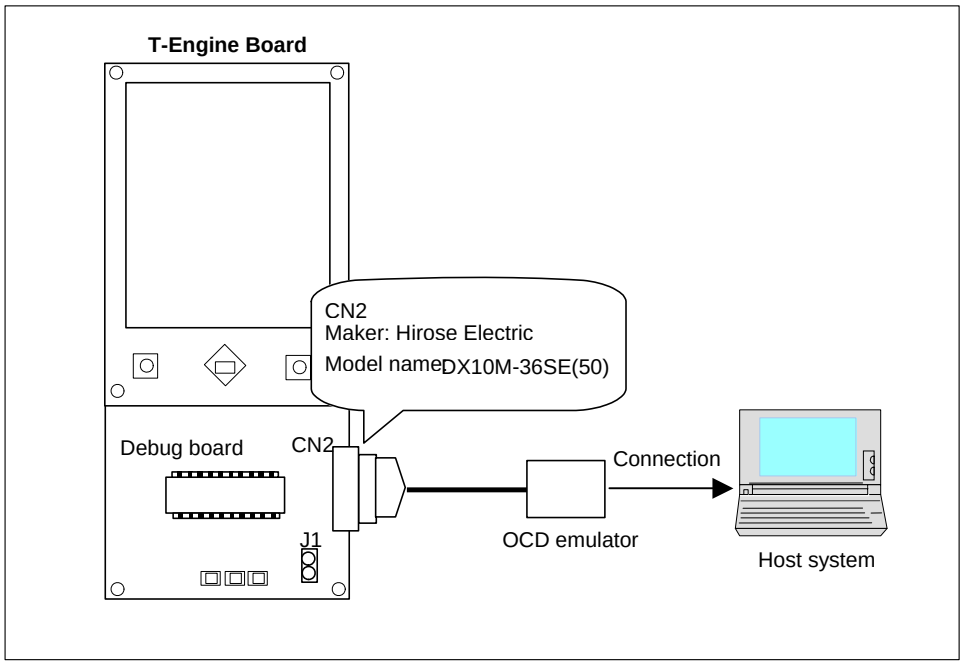

Figure 2.6 H-UDI Debugger Connection

⚠ CAUTION

T-Engine permits the connection of only the H-UDI debugger that uses the AUD and H-UDI pins of the SH7760 board.

3. Switches

3.1 CPU Board Switches

Figure 3.1 shows the location of the switches (SW1 to SW5) on the CPU board. In addition, this section gives a brief description of each switch in (1) to (5).

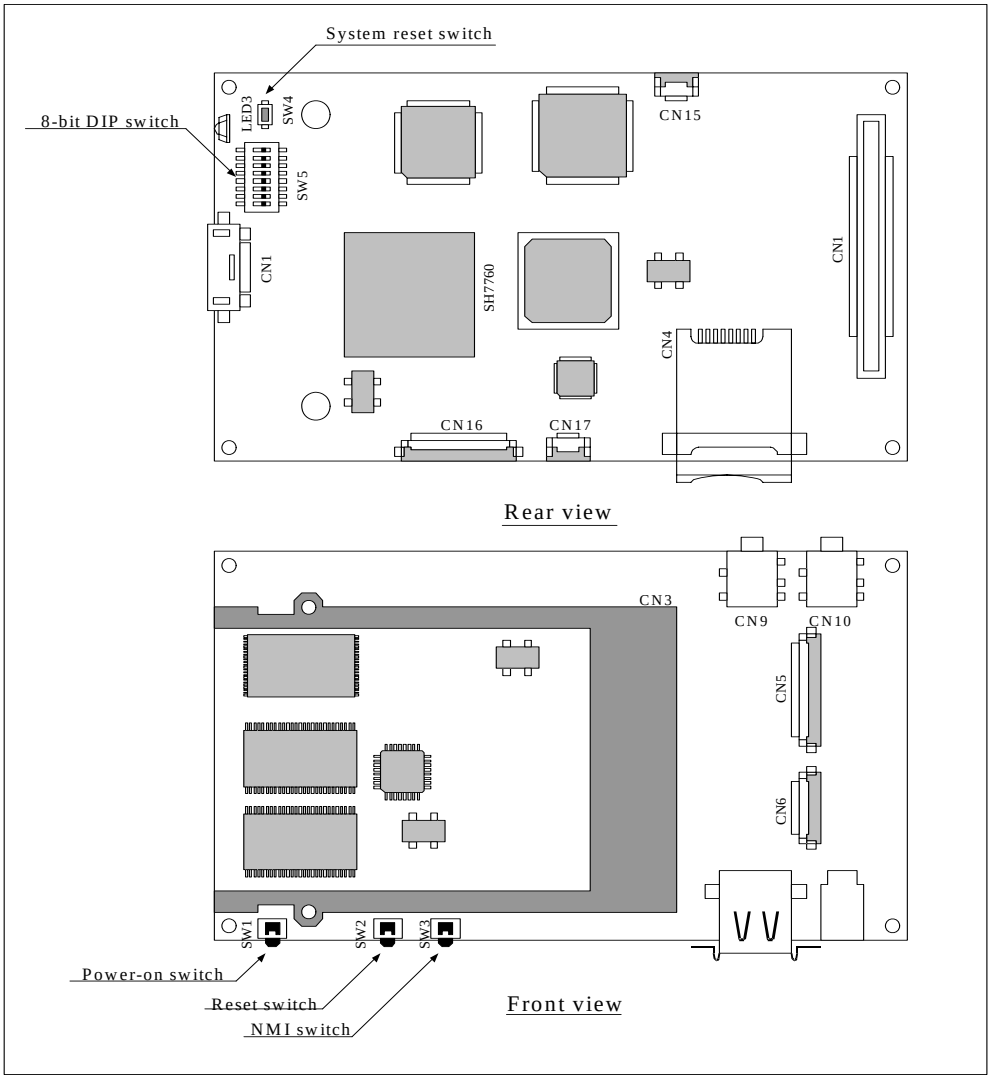

Figure 3.1 CPU Board Switches (SW1 to SW5)

(1) Power on Switch (SW1)

This switch turns on or off T-Engine. To turn on T-Engine, press and hold down this switch for 0.5 seconds or more. To turn it off, press and hold down this switch for 2 seconds or more when T-Engine is being powered.

(2) Reset Switch (SW2)

This switch resets T-Engine. To reset devices other than the H8/3048-ONE, press this switch. To reset and restart T-Engine, release this switch. In this case, the values of H8/3048-ONE internal registers are not initialized. Among the control registers, the values of those that can be accessed by SH7760 are initialized but the others are not (i.e., their values are retained). For more details, refer to 6.12 “Initial Values of the Power Supply Controller Register.”

(3) NMI Switch (SW3)

This switch controls the SH7760 NMI pin. Press this switch and the SH7760 NMI pin will go “Low.” Release this switch, and the NMI pin will go “High.”

(4) System Reset Switch (SW4)

This switch resets the T-Engine hardware. All T-Engine devices are reset so long as this switch is pressed and held down. When this switch is released, T-Engine is turned off. When the power-on switch is pressed,

T-Engine is turned on and started. In addition, if this switch is released while SW5-7 is ON, T-Engine is also turned on.

(5) 8-bit DIP Switch (SW5)

Figure 3.2 shows the setting of an 8-bit DIP switch. This DIP switch is connected to pins ID0 to ID5 and to MD5 of the SH7760. Be sure to turn off the power-on switch before setting the DIP switch.

(a) Switches SW5-1 to SW5-6 are connected to pins ID0 to ID5 (input pins).

ON: The input pin goes “Low.”

OFF: The input pin goes “High.” (Factory setting)

(b) The SW5-7 switch is used to set the power-on condition of T-Engine.

ON: T-Engine is powered when power supply takes place through the AC adapter.

OFF: T-Engine is powered when the power-on switch is pressed. (Factory setting)

(c) The SW5-8 switch is connected to SH7760's pin MD5. The SW5-8 switch is used to set the type of endian for SH7760 operation.

ON: The MD5 pin goes “Low” to set the big endian for SH7760 operation.

OFF: The MD5 pin goes “High” to set the little endian for SH7760 operation. (Factory setting)

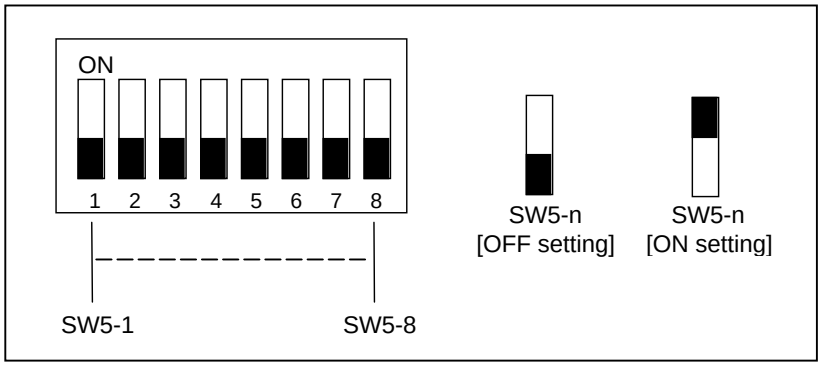

Figure 3.2 Setting the 8-bit DIP Switch

3.2 LCD Board Switch

3.2.1 Application Switch

The states of the cursor switch (SW1) and push-button switches (SW2 and SW3) are signaled to the SH7760 through the power supply controller. For details, refer to 6. “Power Supply Controller.”

3.2.2 LCD configuration switch

Figure 3.3 shows the setting of an 4-bit DIP switch.

(1) SW4-1: The setting of “Display Mode”.

SW4-1:ON SW4-2:ON The Display Mode is QVGA(240X320) (Factory setting)

SW4-1:OFF SW4-2:ON The Display Mode is VGA(480X640)

(2) SW4-2: The setting of “Direction of the LCD vertical scanning”.

SW4-2:ON The LCD display is vertically scanned from (X,Y) toward (X,1).

SW4-2:OFF The LCD display is vertically scanned from (X,1) toward (X,Y). (Factory setting)

(3)SW4-3: The setting of “Direction of the LCD vertical scanning”.

SW4-3:ON The LCD display is vertically scanned from (X,Y) toward (1,Y).

SW4-3:OFF The LCD display is vertically scanned from (1,Y) toward (X,Y). (Factory setting)

(4) SW4-4: TBD

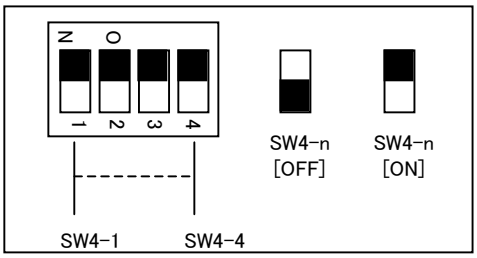

Figure 3.3 Setting the 4-bit DIP Switch

⚠ CAUTION

(1) When SW4-2 and SW4-3 are “Factory setting”, the starting point (0,0) of the LCD display is upper left.

（2）When you change the setting of LCD configuration switch, turn off the power supply of the T-Engine board.

（3）Only can use QVGA(240×320) on SH7760 T-Engine board.

4. Memory Map

4.1 Memory Map for the T-Engine Board

Table 4.1 shows an SH7760 memory map for the T-Engine board without expansion board.

Table 4.1 SH7760 Memory Map for T-Engine without Expansion Board

Area No.	Bus width	Space	Space name	Device	Remarks

5. Functional Blocks

5.1 PCMCIA

5.1.1 Block Description

Figure 5.1 shows the PCMCIA control block. As shown in Figure 5.1, the PCMCIA control block contains a controller (MR-SHPC-01 V2T-F from Marubun Corporation), a 68-pin PC card interface connector (CN3) and a power supply controller IC (TPS2211DB from TI). This controller interfaces with the card(s) conforming to the PC Card Standard 97 and has the following features:

- Internal memory windows (2 windows) and I/O window (one window)
- Card access timing adjustment function
- One-step read/write buffer
- Endian internal control circuit
- Support for 5.0V/3.3V cards
- External buffer not required
- Internal interrupt steering function
- Power-down function
- Internal suspend function

There are four kinds of controller interrupts (SIRQ3 to SIRQ0). Inputs to the H7760 are made by the IRL codes. For details, refer to Marubun's MR-SHPC-01 V2T-F Manual.

Marubun Homepage: http://www.marubun.co.jp/en/index.html

5.2 USB Host

5.2.1 Block Description

Figure 5.2 shows the USB host control block. As shown in Figure 5.2, the SH7760 contains the internal USB host controller. This internal controller supports USB Versions 1.1openHCI has the following features:

- Compatibility with the OpenHCI Version 1.0a register set
- Conforms to the USB Version 1.1
- Provides a route hub function
- Supports the low speed (1.5Mbps) and full speed (12MB) modes
- Supports an overcurrent detection function
- Supports a maximum of 127 endpoints
- Capable of using the shared memory (8K) for transfer data and descriptors

For details, refer to the pertinent SH7760 Hardware Manual.

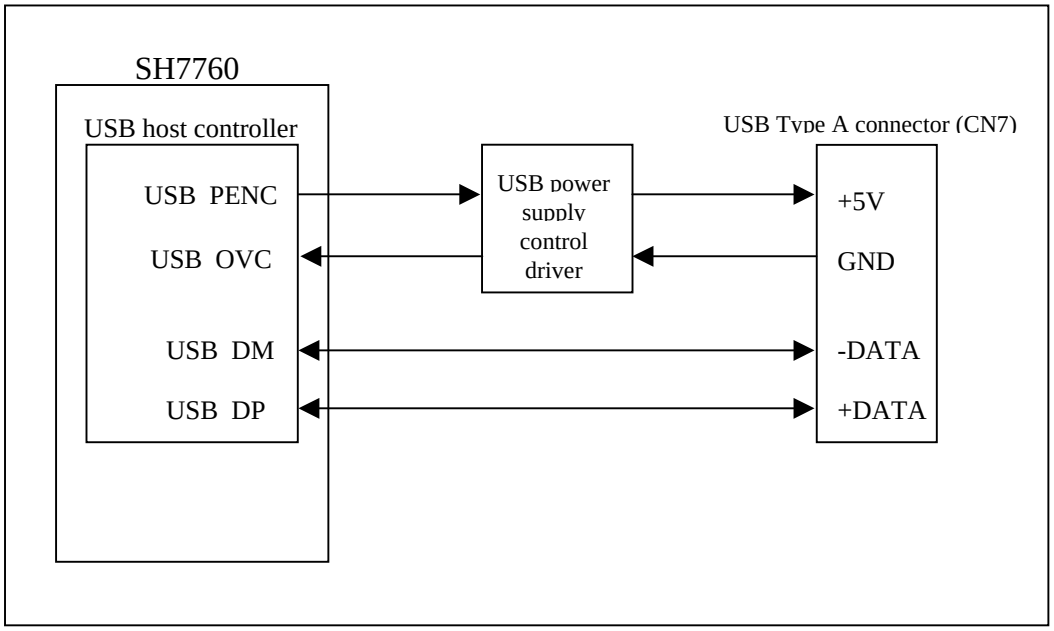

Figure 5.2 USB Host Control Block

5.2.2 Connector Pins

5.3 UART

5.3.1 Block Description

Figure 5.4 shows the UART control block. As shown in Figure 5.4, the UART control block contains the controller (XR16L2550IM-F from EXAR), RS232C interface driver, and 16-pin connector (CN1). This controller uses the clock pulses (7.3728MHz) supplied from the power supply controller for operations, and determines a baud rate (transfer rate) using these pulses as reference.

This controller has been provided with a 2-channel UART device. Channel A is used to communicate with the power supply controller. Because channel B is connected to a 16-pin RS-232C connector (CN1), it can be used as a debug interface if it is connected to a PC.

In addition, there are two kinds of controller interrupts (INTA and INTB). Inputs to the H7760 are made by the IRL codes. For details, refer to EXAR's XR16L2550IM-F Manual.

5.4 LCD

5.4.1 Block Description

Figure 5.6 shows the LCD control block. As shown in Figure 5.6, the LCD control block contains an internal LCD controller and an LCD panel (TFT liquid crystal panel) mounted on the LCD board that can display 16-bit RGB data with a resolution of QVGA (240 x 320).

Display data is stored in the internal SDRAM of the LCD controller in the order of coordinates (0,0), (1,0), … and (239, 319) from the address set in the register (LDSARU) of the LCD controller. On the LCD panel display, data at the upper left corner is handled as data on the origin (0,0) and data at the lower right corner is handled as data on the coordinates (239,319).

The front light on the LCD panel can be turned on or off by the power supply controller. For details on front light control, refer to 6. “Power Supply Controller.” In addition, refer to the pertinent SH7760 Hardware Manual for details on the LCD controller.

5.5 Sound Generator

5.5.1 Block Description

Figure 5.8 shows the sound generator control block. As shown in Figure 5.8, this control block contains the serial sound interface (SSI) of the SH7760 and the Audio CODEC (UDA1342TS from Philips), so that sound can be output to headphones connected to the output mini-jack (CN9) or can be input to earphones connected to the I/O mini-jack (CN10). In addition, headphone output takes place with the quality of stereo output while earphone I/O takes place with the quality of monaural I/O that uses only the Rch.

The IIC interface of the SH7760 is used for the initial setting and for modification of the Audio CODEC internal registers.

This control block is connected to an electronic volume so that sound output volume can be controlled. The electronic volume is controlled by the power supply controller. For details, refer to 6, “Power Supply Controller.”

T-Engine has the following characteristics for microphone input and headphone output:

- Microphone input
  - Impedance: 2.2KΩ
  - Sensitivity: -51dB/Pa
- Headphone output
  - Impedance: 32Ω

For more details, refer to the SH7760 Hardware Manual or the Philips UDA1342TS Manual.

5.6 eTRON Interface

5.6.1 Block Description

Figure 5.10 shows an eTRON interface control block. As shown in Figure 5.10, this control block contains the SIM card module of the SH7760, the power supply/level converter (LTC1555LEGN-1.8), and the 8-pin connector (CN4) to interact with the eTRON card inserted into the eTRON interface connector (CN4).

The eTRON card can be reset by controlling the SH7760 internal SIM card module register (SISCMR).
The control method is shown below.

"Low" output from SISCMR: The reset pin of the eTRON card is set to "Low." (Reset state)
"High" output from SISCMR: The reset pin of the eTRON card is set to "High." (Normal state)

Power supply to the eTRON card is controlled via the power supply controller. However, when the T-Engine board is ON, the eTRON card is being powered. When inserting or removing the eTRON card, be sure to turn off T-Engine in advance. For more information, refer to the pertinent SH7760 Hardware Manual.

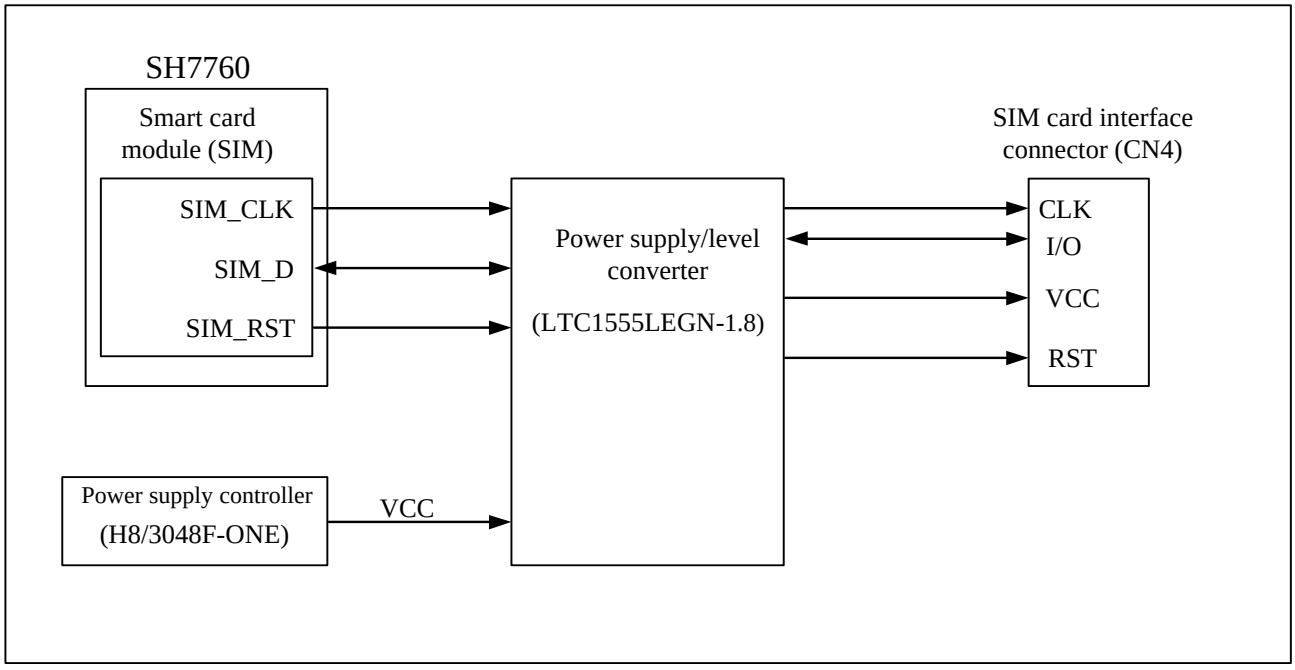

Figure 5.11 eTRON Interface Control Block

5.6.2 Connector Pins

Figure 5.12 shows the pins of the SIM card interface connector (CN4). Table 5.12 summarizes the signals of the SIM card interface connector (CN4).

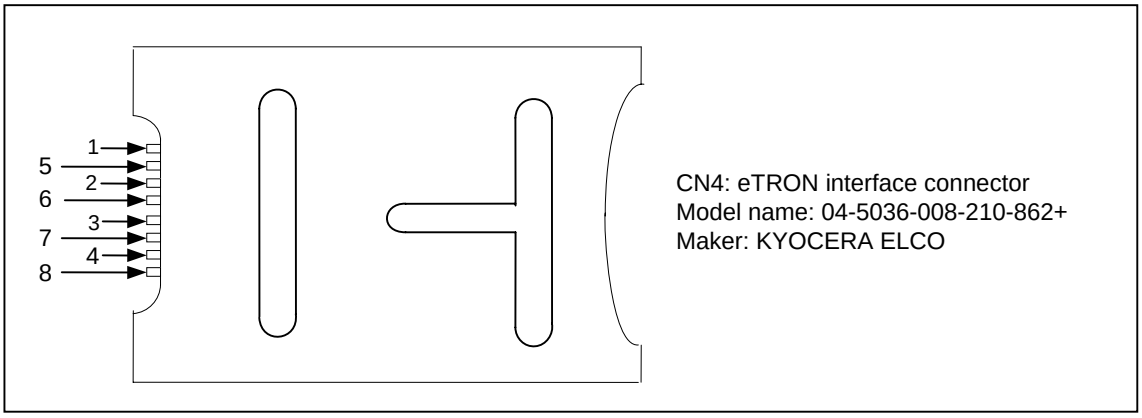

Figure 5.12 eTRON Interface Connector (CN4) Pins

Table 5.12 eTRON Interface Connector (CN4) Signals

Pin No	Signal Name
1	C1:VCC
2	C2:RST
3	C3:CLK
4	C4:*1
5	C5:GND
6	C6:VPP
7	C7:I/O
8	C8: *1

*1: Pins 4 and 8 are connected to the connector (CN13) for board test. Don’t use this connector for the other purpose.

5.6.3 Register Map

Table 5.13 shows a register map for the SH7760 SIM card module (SIM).

Table 5.13 SIM Card Module Register Map

Address	Initial value	Register name
H'FE480000	H'20	Serial mode register
H'FE480002	H'07	Bit rate register
H'FE480004	H'00	Serial control register
H'FE480006	H'FF	Transmit data register

H'FE480014	H'0173	Sample register

5.7 I/O Board

5.7.1 Block Description

Figure 5.13 shows the control block of an I/O board. As shown in Figure 5.13, the SH7760 module pins output signals to the connectors (through-holes), which provide various interfaces with the external device.
As the connector is not installed, when an external pin is to be connected, it should be directly connected to the through-hole, or the connector should be installed.

The internal modules, which output the signals, are listed below.

- Controller area network 2 (HCAN2): 2ch
- Serial communication interface (SCIF): 2ch
- IIC bus interface: 1ch
- A/D converter: 4ch
- Compare match timer (CMT)

For details on each module, refer to the pertinent SH7760 Hardware Manual.

6. Power Supply Controller

6.1. Power Supply Controller Functions

The H8/3048F-ONE power supply controller (simply called the power supply controller) provides the following control functions with firmware stored in the internal memory. The following functions can be controlled through the UART ChA from the SH7760. Figure 6.1 shows a power supply controller block diagram.

(1) RTC (real-time clock) function
(2) System power supply (3.3V/5/0V) ON/OFF control function
(3) Touch panel coordinate position read function
(4) Key switch input function
(5) Infrared remote control transmission/reception function
(6) Electronic volume
(7) Serial EEPROM read/write function

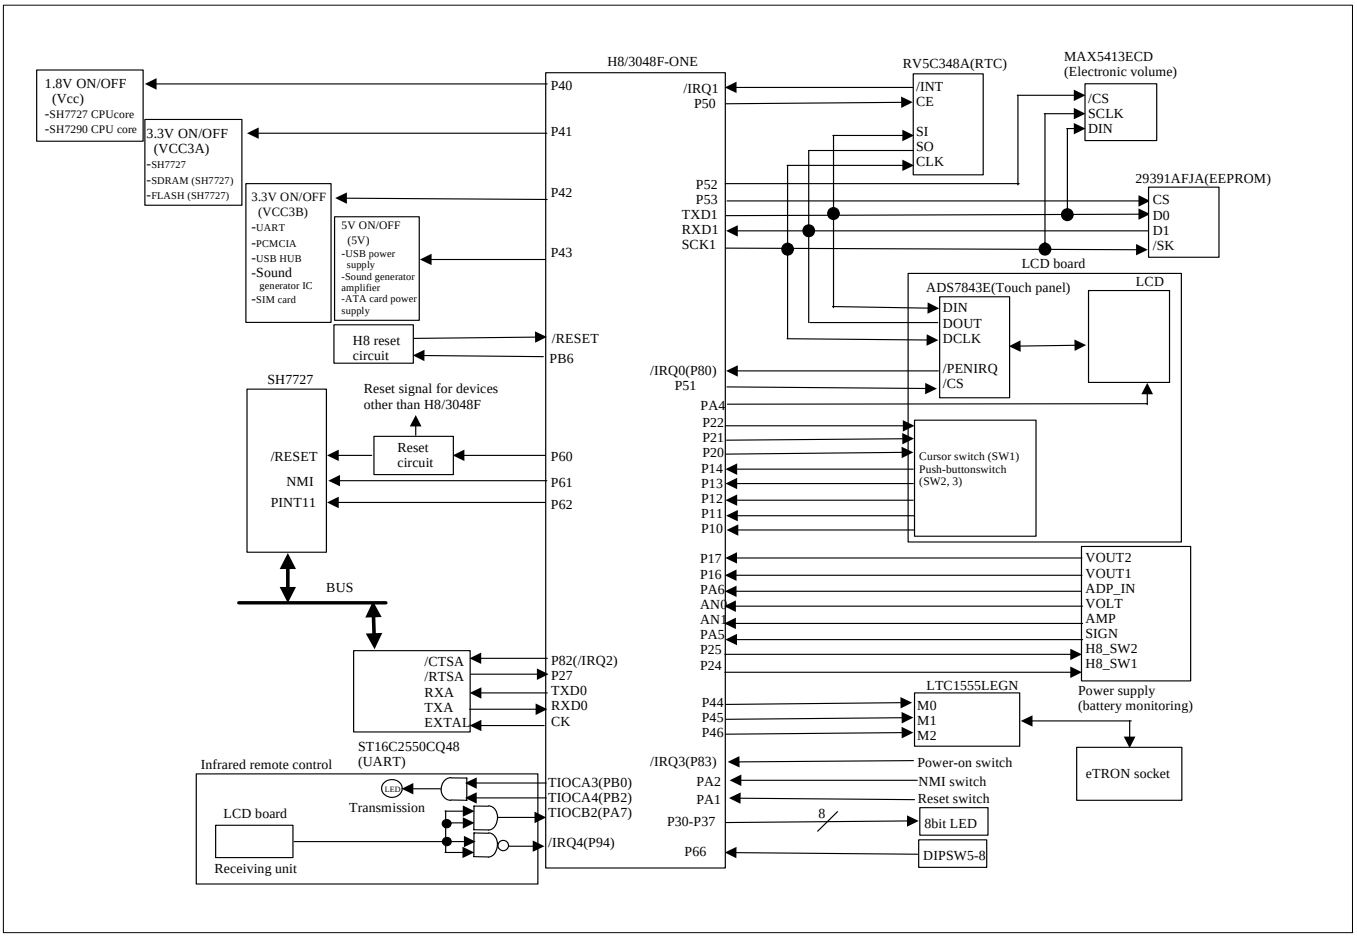

Figure 6.1 Power Supply Control Block Diagram

⚠ CAUTION

Though the power supply controller's I/O port is connected to the /RTSA and /CTSA pins of the UART controller through the circuit, the power supply controller does not execute hardware control during communications with SH7760. For details of communications between SH7760 and the power supply controller, refer to 6.2 “Serial Communications between SH7760 and the Power Supply Controller.”

6.2 Serial Communications between SH7760 and the Power Supply Controller

This section describes how serial communications take place between SH7760 and the power supply controller.

6.2.1 Serial Format

This subsection describes a format for serial communications between SH7760 and the power supply controller.

(1) Mode: Start-stop

(2) Baud rate: 38400 bits/second

(3) Stop bit: 1 bit

(4) Start bit: 1 bit

(5) Parity bit: None

(6) LSB first

6.2.2 Power Supply Control Register Read Procedure

This subsection describes a procedure for reading the power supply control registers.

(1) SH7760 issues a read command to a power supply controller.

(2) The power supply controller returns a response to SH7760.

⚠ CAUTION

Don’t issue multiple commands continually from SH7760. Note that the next command must be issued after a response to the preceding command has been returned from the power supply controller.

6.2.3 Read Command

Figure 6.2 shows a read command format. SH7760 sends a start code, a function code and a register address, in this order, as a read command.

(1) Start code (1 byte)	(2) Function code (1 byte or 2 bytes)	(3) Register address (2 bytes)

Figure6.2 Read Command

(1) Start code

The code is fixed at 0x02.

(2) Function code

A 1-byte function code specifies the size of data to be read in the lower 4 bits when the upper 4 bits of a function code are 1000. Figure 6.3 shows a function command where the upper 4 bits are 1000.

D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	Size of data			

Figure6.3 Function Command (1 Byte)

A 2-byte function code specifies the size of data to be read in the lower 12 bits when the upper 4 bits of a function code are 1001. Figure 6.4 shows a function command where the upper 4 bits are 1001.

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	1	Size of data											

Figure6.4 Function Command (2 Bytes)

(3) Register Address

The register address specifies the address of the register to be read.

6.2.4 Normal Response during a Read Operation

Figure 6.5 shows the response format for the read command. The power supply controller returns an ACK code, a function code, a register address and target data, in this order, as a response.

(1) ACK code(1 byte)	(2) Function code (1 byte or 2 bytes)	(3) Register address (2 bytes)	(4) Data (N byte)

Figure 6.5 Normal Response during a Read Operation

(1) ACK code

The code is fixed at ACK (0x06).

(2) Function code

The same function code as for the read command returns.

(3) Register address

The address of a register subject to a read operation returns.

(4) Data

Read data returns. The size of this data is equal to the value specified in the function code.

6.2.5 Error Response during a read Operation

Figure 6.6 shows the error response format for the read command. The power supply controller returns a NAK code and an error code in this order as a response at error occurrence.

(1) NAK code (1 byte)	(2) Error code (1byte)

Figure 6.6 Error Response during a Read Operation

(1) NAK code

This code is fixed at NAK (0x15).

(2) Error code

Table 6.1 summarizes the error codes.

Table 6.1 Error Codes

Error No	Error type
0x01	Communications error
0x02	Invalid function code
0x03	Invalid register number
0x04	Register size error
0x05	Data size error

6.2.6 Power Supply Control Register Write Procedure

This subsection describes the procedure for writing to a controller control of the power supply controller from SH7760.

(1) SH7760 issues a write command to the power supply controller.

(2) The power supply controller returns a response the SH7760.

⚠ CAUTION

Don't issue multiple commands continually from SH7760. Note that the next command must be issued after a response to the preceding command has been returned from the power supply controller.

6.2.7 Write Command

Figure 6.7 shows the write command format. SH7760 sends a start code, a function code, a register address and data, in this order, as a write command.

(1) Start code (1 byte)	(2) Function code (1 byte or 2 byte)	(3) Register address (2 byte)	(4) Register address (N byte)

Figure 6.7 Read Command

(1) Start code

This code is fixed at 0x02.

(2) Function code

A 1-byte function code specifies the size of data to be written in the lower 4 bits when the upper 4 bits of a function code are 1100. Figure 6.8 shows a function command where the upper 4 bits are 1100.

D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	0	Size of data			

Figure 6.8 Function Command (1 Byte)

A 2-byte function code specifies the size of data to be written in the lower 12 bits when the upper 4 bits of a function code are 1101. Figure 6.9 shows a function command where the upper 4 bits are 1101.

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	1	Size of data											

Figure 6.9 Function Command (2 Bytes)

(3) Register Address

The register address specifies the address of the register to be written.

(4) Data

This field specifies the size of data to be written. This data size is equal to that specified in the function code.

6.2.8 Normal Response during a Write Operation

Figure 6.10 shows the response format for the write command. The power supply controller returns an ACK code, a function code, a register address and target data, in this order, as a response for the write command.

(1) ACK code (1 byte)	(2) Function code (1 byte or 2 byte)	(3) Register address (2 byte)	(4) Data (N byte)

Figure 6.10 Normal Response during a Write Operation

(1) ACK code

This code is fixed at ACK (0x06).

(2) Function code

The same code as for the write command returns.

(3) Register address

The address of a register subject to a write operation returns.

(4) Data

Write data returns. The size of this data is equal to the value specified in the function code. However, note that no data returns for IRRSFDR subject to infrared remote control and EEPDR subject to serial EEPROM control.

6.2.9 Error Response during a Write Operation

Figure 6.11 shows an error response format for the write command at error occurrence. The power supply controller returns a NAK code and an error code in this order as an error response.

Figure 6.11 Error Response during a Write Operation

(1) NAK code

This code is fixed at NAK (0x15).

(2) Error code

Table 6.2 summarizes the error codes.

Table 6.2 Error Codes

Error Code No.	Error type
0x01	Communications error
0x02	Invalid function code
0x03	Invalid register number
0x04	Register size error
0x05	Data size error

6.3 RTC (Real-time Clock) Functions

This section describes the RTC functions. Table 6.3 summarizes the RTC registers. For a detailed description of each register, refer to 6.3.1 to 6.3.17.

(1) Function for counting the seconds, minutes, hours, day of the week, month, and year (BCD code)

(2) RTC start/stop function

(3) Alarm interrupt function

(4) 1sec/0.5sec cyclic interrupt function

(5) Automatic correction function for leap years

(6) Effective range of operation from January 1, 2000 to December 31, 2099

Table 6.3 RTC Registers

Register	Abbreviation	Address	R/W	Size	Remarks
RTC control register	RTCCR	0x0000	R/W	1 byte	
RTC status register	RTCSR	0x0001	R/W	1 byte	
Second counter	SECCNT	0x0002	R/W	1 byte	
Minute counter	MINCNT	0x0003	R/W	1 byte	
Hour counter	HRCNT	0x0004	R/W	1 byte	
Day-of-the-week counter	WKCNT	0x0005	R/W	1 byte	
Day counter	DAYCNT	0x0006	R/W	1 byte	
Month counter	MONCNT	0x0007	R/W	1 byte	
Year counter	YRCNT	0x0008	R/W	1 byte	
Second alarm counter	SECAR	0x0009	R/W	1 byte	
Minute alarm counter	MINAR	0x000A	R/W	1 byte	
Hour alarm counter	HRAR	0x000B	R/W	1 byte	
Day-of-the-week alarm counter	WKAR	0x000C	R/W	1 byte	
Day alarm counter	DAYAR	0x000D	R/W	1 byte	
Month alarm counter	MONAR	0x000E	R/W	1 byte	
RTC/Touch panel/Key input/Power supply status register	RTKISR	0x0090	R/W	1 byte	

6.3.1 RTC Control Register (RTCCR)

Address: 0x000 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	CNTS	SECCAF	0.5secI	1secI	ARI	START
R	R	R/W	R/W	R/W	R/W	R/W	R/W

(1) START

START bit	Setting
0	RTC start (Initial value)
1	RTC stop

⚠ CAUTION

Don't write to any counter while the START bit is set to "0." Rewrite each counter after setting the START bit to "1."

(2) ARI

ARI bit	Setting
0	No alarm interrupt is generated (Initial value)
1	An alarm interrupt is generated

(3) 1secI

1secI bit	Setting
0	No interrupt is generated at intervals of 1 second. (Initial value)
1	An interrupt is generated at intervals of 1 second.

(4) 0.5secI

0.5secI bit	Setting
0	No interrupt is generated at intervals of 0.5 second. (Initial value)
1	An interrupt is generated at intervals of 0.5 second.

(5) SECCAF

SECCAF bit	Setting
0	No carry has been generated in the second counter (SECCNT). (Initial value)
1	A carry has been generated in the second counter (SECCNT). [Zero-clear condition] The SECCAF bit is set to "1.''

(6) CNTS

CNTS bit	Setting
0	The setting (value) of each counter is not updated. (Initial value)
1	The setting (value) of each counter is updated. [Zero-clear condition] Counter update is completed. This clear operation is automatically performed.

6.3.2 RTC Status Register (RTCSR)

Address: 0x001 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0.5 secF	1 secF	ARF	0
R	R	R	R	R/W	R/W	R/W	R

(1) ARF

ARF bit	Setting
0	The setting of each alarm register with the AR bit set is not the same as that of each counter register (Initial value)
1	The setting of each alarm register with the AR bit set is identical to that of each counter register. At this time, an interrupt occurs if the ARI bit is set to “1.’’ [Clear condition] “0’’ is written with the ARF bit set to “1.’’

(2) 1secF

1secF bit	Setting
0	A second has not elapsed yet (Initial value)
1	A second has elapsed. [Clear condition] “0’’ is written with the 1secF bit set to “1.’’

(3) 0.5secF

0.5secF bit	Setting
0	A half second has not elapsed yet. (Initial value)
1	A half second has elapsed yet. [Clear condition] “0’’ is written with the 0.5secF bit set to “1.’’

6.3.3 Second Counter (SECCNT)

Address: 0x002 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	10 seconds			1 second			
R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 00 to 59. When the value changes from 59 to 00, a carry is generated in the minute counter.

6.3.4 Minute Counter (MINCNT)

Address: 0x0003 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	10 minutes			1 minute			
R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 00 to 59. When the value changes from 59 to 00, a carry is generated in the hour counter.

6.3.5 Hour Counter (HRCNT)

Address: 0x0004 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	0	10 hours		1 hour			
R	R	R/W	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 00 to 23. When the value changes from 23 to 00, a carry is generated in the day counter and the day-of-the-week counter.

6.3.6 Day-of-the-Week Counter (WKCNT)

Address: 0x0005 Initial Value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	Septinary incremental counter		
R	R	R	R	R	R/W	R/W	R/W

Counting takes place within a range from 0x00 to 0x06.

The following shows the correspondence between the day of the week and the value of the septinary incremental counter.

(D2.D1.D0) = (0.0.0) →Sunday

(D2.D1.D0) = (0.0.1) →Monday

(D2.D1.D0) = (0.1.0) →Tuesday

(D2.D1.D0) = (0.1.1) →Wednesday

(D2.D1.D0) = (1.0.0) →Thursday

(D2.D1.D0) = (1.0.1) →Friday

(D2.D1.D0) = (1.1.0) →Saturday

6.3.7 Day Counter (DAYCNT)

Address: 0x0006 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	0	10 days		1 day			
R	R	R/W	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 1 to 31 (January, March, July, August, October and December), 1 to 30 (April, June, September and November), 1 to 28 (February in normal year) or 1 to 29 (February in leap year).

6.3.8 Month Counter (MONCNT)

Address: 0x0007 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	10 months	1 month			
R	R	R	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 1 to 12. When the counter value changes from 12 to 1, a carry is generated in the year counter.

6.3.9 Year Counter (YRCNT)

Address: 0x0008 Initial value: 0xXX (Not defined)

D7	D6	D5	D4	D3	D2	D1	D0
10 years				1 year			
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The counter value is a BCD (Binary Coded Decimal) value. Counting takes place within a range from 0 to 99. In this range, 00, 04, ..., 92 and 96 are leap years.

6.3.10 Alarm Register

Each alarm register corresponds to the relevant counter as shown below.

If the AR bit (D7) of each alarm is set to “1,” counters will be compared with alarm registers. This comparison is performed only for alarm registers with the AR bit (D7) set to “1” and an alarm interrupt is generated only at correct correspondence.

Correspondence between the alarm registers and counters

Second alarm register (BCD code): second counter

Minute alarm register (BCD code): minute counter

Hour alarm register (BCD code): Hour counter

Day-of-the-week alarm register (0x00 to 0x07): Day-of-the-week counter

Day alarm register (BCD code): Day counter

Month alarm register (BCD code): Month counter

6.3.11 Second Alarm Register (SECAR)

Address: 0x0009 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	10 seconds			1 second			
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The alarm value must be a BCD (Binary Coded Decimal) code between 00 and 59.

6.3.12 Minute Alarm Register (MINAR)

Address: 0x000A Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	10 minutes			1 minute			
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The alarm value must be a BCD (Binary Coded Decimal) code between 00 and 59.

6.3.13 Hour Alarm Register (HRAR)

Address: 0x000B Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	0	10 hours		1 hour			
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

The alarm value must be a BCD (Binary Coded Decimal) code between 00 and 23.

6.3.14 Day-of-the-Week Alarm Register (WKAR)

Address: 0x000C Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	0	0	0	0	Septinary counter value		
R/W	R	R	R	R	R/W	R/W	R/W

The alarm value must be set within a range from 0x00 to 0x06.

• Day of the week and septinary counter value

(D2.D1.D0) = (0.0.0) → Sunday

(D2.D1.D0) = (0.0.1) → Monday

(D2.D1.D0) = (0.1.0) → Tuesday

(D2.D1.D0) = (0.1.1) → Wednesdady

(D2.D1.D0) = (1.0.0) → Thursday

(D2.D1.D0) = (1.0.1) → Friday

(D2.D1.D0) = (1.1.0) → Saturday

6.3.15 Day Alarm Register (DAYAR)

Address: 0x000D Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	0	10 days		1 day			
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

The alarm value must be a BCD (Binary Coded Decimal) code between 1 and 31 (January, March, May, July, August, October and December), between 1 and 30 (April, June, September and November), between 1 and 28 (February in normal year) or between 1 and 29 (February in leap year).

6.3.16 Month Alarm Register (MONAR)

Address: 0x000E Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
AR	0	0	10 months	1 month			
R/W	R	R	R/W	R/W	R/W	R/W	R/W

The alarm value must be a BCD (Binary Coded Decimal) code between 01 and 12.

6.3.17 RTC/Touch Panel/Key Input/Power Supply Status Register (RTKISR)

This status register indicates the RTC, touch panel or key input status. The following is a brief description of RTC-related status bits.

Address: 0x0090 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	IRRIF	POWERIF	KEYIF	TPIF	RTCIF
R	R	R	R/W	R/W	R/W	R/W	R/W

(1) RTCIF

RTCIF bit	Setting
0	The ARF, 1secF ad 0.5secF bits of the RTC register are all set to “0.’’ (Initial value)
1	One of the ARF, 1secF ad 0.5 secF bits of the RTC register is set to “1.’’ [Clear condition] “0’’ is written with the RTCIF bit set to ‘’1.’’

6.4 Touch Panel Functions

This section describes the touch panel functions. In addition, Table 6.4 summarizes the touch panel registers. For details of each register, refer to 6.4.1 to 6.4.32.

(1) The A/D conversion value of the X or Y position sensed by pen touch is output.

(2) Pen touch ON/OFF interrupt function

Sampling takes place at intervals of 20msec to 100msec. When the results (A/D conversion value of the X or Y position) obtained three times from sampling are approximate to each other, a pen touch ON interrupt is generated for SH7760. In addition, when the touch panel is turned off, a pen touch OFF interrupt is generated.

(3) To keep the pen touch “ON,” sampling is performed at intervals of 20msec to 100msec and a pen touch ON interrupt is generated if the results obtained from sampling are approximate to each other.

(4) Calibration function

Calibration is performed when two points on the touch panel are touched with the pen.
After completion of calibration, the X and Y positions are converted into the LCD drawing dot positions for output.

Table 6.4 Touch Panel Registers

Register	Abbreviation	Address	R/W	Size	Remarks
Touch panel control register	TPLCR	0x0020	R/W	1 byte	
Touch panel status register	TPLSR	0x0021	R/W	1 byte	
Touch panel sampling control register	TPLSCR	0x0022	R/W	1 byte	
X position A/D register	XPAR	0x0024	R	2 bytes	
Y position A/D register	YPAR	0x0026	R	2 bytes	
X position dot register	XPDR	0x0028	R	2 bytes	
Y position dot register	YPDR	0x002A	R	2 bytes	
XA position dot register	XAPDR	0x002C	R/W	2 bytes	
YA position dot register	YAPDR	0x002E	R/W	2 bytes	
XB position dot register	XBPDR	0x0030	R/W	2 bytes	
YB position dot register	YBPDR	0x0032	R/W	2 bytes	
XC position dot register	XCPDR	0x0034	R/W	2 bytes	
YC position dot register	YCPDR	0x0036	R/W	2 bytes	
XA position A/D register	XAPAR	0x0038	R/W	2 bytes	
YA position A/D register	YAPAR	0x003A	R/W	2 bytes	
XB position A/D register	XBPAR	0x003C	R/W	2 bytes	
YB position A/D register	YBPAR	0x003E	R/W	2 bytes	
XC position A/D register	XCPAR	0x0040	R/W	2 bytes	
YC position A/D register	YCPAR	0x0042	R/W	2 bytes	
DX dot register	DXDR	0x0044	R/W	2 bytes	
DY dot register	DYDR	0x0046	R/W	2 bytes	
X position dot calculation A/D value	XPARDOT	0x0048	R/W	2 bytes	
X position A/D value 1	XPARDOT1	0x004A	R/W	2 bytes	
X position A/D value 2	XPARDOT2	0x004C	R/W	2 bytes	
X position A/D value 3	XPARDOT3	0x004E	R/W	2 bytes	
X position A/D value 4	XPARDOT4	0x0050	R/W	2 bytes	
Y position dot calculation A/D value	YPARDOT	0x0052	R/W	2 bytes	
Y position A/D value 1	YPARDOT1	0x0054	R/W	2 bytes	
Y position A/D value 2	YPARDOT2	0x0056	R/W	2 bytes	
Y position A/D value 3	YPARDOT3	0x0058	R/W	2 bytes	
Y position A/D value 4	YPARDOT4	0x005A	R/W	2 bytes	
RTC/Touch Panel/Key Input/Power Supply Status Register	RTKISR	0x0090	R/W	1 byte	

6.4.1 Touch Panel Control Register (TPLCR)

Address: 0x0020 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	PEN_ONRE	PEN_OFFI	PEN_ONI	TP_STR
R	R	R	R	R/W	R/W	R/W	R/W

(1) TP_STR

TP_STR bit	Setting
0	The touch panel is disabled. (Initial value)
1	The touch panel is enabled.

(2) PEN_ONI

PEN_ONI bit	Setting
0	A pen touch ON interrupt is not generated. (Initial value)
1	A pen touch ON interrupt is generated.

(3) PEN_OFFI

PEN_OFFI bit	Setting
0	A pen touch OFF interrupt is not generated. (Initial value)
1	A pen touch OFF interrupt is generated.

(4) PEN_ONRE

PEN_ ONRE bit	Setting
0	A pen touch ON interrupt is not generated when pen touch continues. (Initial value)
1	A pen touch ON interrupt is generated when pen touch continues.

6.4.2 Touch Panel Status Register (TPLSR)

Address: 0x0021 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	PEN_OFFIF	PEN_ONIF	0
R	R	R	R	R	R/W	R/W	R

(1) PEN_ONIF

PEN_ONIF bit	Setting
0	The touch panel has not been pen-touched. (pen touch OFF.) (Initial value)
1	The pen-touch state on the touch panel has been changed from OFF to ON. The touched positions on the touch panel are output to the X position A/D register, Y position A/D register, X position dot register and Y position dot register. At this time, a pen touch ON interrupt is generated if the PEN_ONI bit is set to “1.’’ [Clear condition] “0’’ is written with the PEN_ONIF bit set to ‘’1.’’

(2) PEN_OFFIF

PEN_OFFIF bit	Setting
0	The touch panel has not been pen-touched. (pen touch OFF.) (Initial value)
1	The pen-touch state on the touch panel has been changed from ON to OFF. At this time, a pen touch OFF interrupt is generated if the PEN_OFFI bit is set to “1.’’ [Clear condition] “0’’ is written with the PEN_OFFIF bit set to ‘’1.’’

6.4.3 Touch panel Sampling Control Register (TPLSCR)

The touch panel sampling control register sets a sampling interval for the touch panel.

Address: 0x0022 Initial value: 0x01

D7	D6	D5	D4	D3	D2	D1	D0
160msec	140msec	120msec	100msec	80msec	60msec	40msec	20msec
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A sampling interval for the touch panel can be set within a range from 20msec to 160msec (unit: 20msec). When a bit is set to “1,” the corresponding sampling interval from 20msec to 160msec is set. Note that only the following values can be specified.

Correspondence between the setting values and sampling intervals

0x01: 20msec

0x02: 40msec

0x04: 60msec

0x08: 80msec

0x10: 100msec

0x20: 120msec

0x40: 140msec

0x80: 160msec

6.4.4 X Position A/D Register (XPAR)

Address: 0x0024 Initial value: 0x000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	XA_D11	XA_D10	XA_D9	XA_D8
R	R	R	R	R	R	R	R

D7	D6	D5	D4	D3	D2	D1	D0
XA_D7	XA_D6	XA_D5	XA_D4	XA_D3	XA_D2	XA_D1	XA_D0
R	R	R	R	R	R	R	R

The X position A/D register indicates the A/D conversion result of a pen-touched X position on the touch panel.

6.4.5 Y Position A/D Register (YPAR)

Address: 0x0026 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	YA_D11	YA_D10	YA_D9	YA_D8
R	R	R	R	R	R	R	R

D7	D6	D5	D4	D3	D2	D1	D0
YA_D7	YA_D6	YA_D5	YA_D4	YA_D3	YA_D2	YA_D1	YA_D0
R	R	R	R	R	R	R	R

The Y position A/D register indicates the A/D conversion result of a pen-touched Y position on the touch panel.

6.4.6 X Position Dot Register (XPDR)

Address: 0x0028 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
XD_D15	XD_D14	XD_D13	XD_D12	XD_D11	XD_D10	XD_D9	XD_D8
R	R	R	R	R	R	R	R

D7	D6	D5	D4	D3	D2	D1	D0
XD_D7	XD_D6	XD_D5	XD_D4	XD_D3	XD_D2	XD_D1	XD_D0
R	R	R	R	R	R	R	R

The X position dot register indicates the dot position of a pen-touched X position on the touch panel. Use the output value of this register after calibration. The output value is not settled without calibration.

6.4.7 Y Position Dot Register (YPDR)

Address: 0x002A Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
YD_D15	YD_D14	YD_D13	YD_D12	YD_D11	YD_D10	YD_D9	YD_D8
R	R	R	R	R	R	R	R

D7	D6	D5	D4	D3	D2	D1	D0
YD_D7	YD_D6	YD_D5	YD_D4	YD_D3	YD_D2	YD_D1	YD_D0
R	R	R	R	R	R	R	R

The Y position dot register indicates the dot position of a pen-touched Y position on the touch panel. Use the output value of this register after calibration. The output value is not settled without calibration.

6.4.8 XA Position Dot Register (XAPDR)

Address: 0x002C Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
XAD_D15	XAD_D14	XAD_D13	XAD_D12	XAD_D11	XAD_D10	XAD_D9	XAD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XAD_D7	XAD_D6	XAD_D5	XAD_D4	XAD_D3	XAD_D2	XAD_D1	XAD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XA position dot register indicates the X dot position of point A when calibration takes place.

6.4.9 YA Position Dot Register (YAPDR)

Address: 0x002E Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
YAD_D15	YAD_D14	YAD_D13	YAD_D12	YAD_D11	YAD_D10	YAD_D9	YAD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YAD_D7	YAD_D6	YAD_D5	YAD_D4	YAD_D3	YAD_D2	YAD_D1	YAD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YA position dot register indicates the Y dot position of point A when calibration takes place.

6.4.10 XB Position Dot Register (XBPDR)

Address: 0x0030 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
XBD_D15	XBD_D14	XBD_D13	XBD_D12	XBD_D11	XBD_D10	XBD_D9	XBD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XBD_D7	XBD_D6	XBD_D5	XBD_D4	XBD_D3	XBD_D2	XBD_D1	XBD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XB position dot register indicates the X dot position of point B when calibration takes place.

6.4.11 YB Position Dot Register (YBPDR)

Address: 0x0032 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
YBD_D15	YBD_D14	YBD_D13	YBD_D12	YBD_D11	YBD_D10	YBD_D9	YBD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YBD_D7	YBD_D6	YBD_D5	YBD_D4	YBD_D3	YBD_D2	YBD_D1	YBD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YB position dot register indicates the Y dot position of point B when calibration takes place.

6.4.12 XC Position Dot Register (XCPDR)

Address: 0x0034 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
XCD_D15	XCD_D14	XCD_D13	XCD_D12	XCD_D11	XCD_D10	XCD_D9	XCD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XCD_D7	XCD_D6	XCD_D5	XCD_D4	XCD_D3	XCD_D2	XCD_D1	XCD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XC position dot register indicates the X dot position of point C when calibration takes place. This register will be functionally enhanced in future. Don't access this register.

6.4.13 YC Position Dot Register (YCPDR)

Address: 0x0036 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
YCD_D15	YCD_D14	YCD_D13	YCD_D12	YCD_D11	YCD_D10	YCD_D9	YCD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YCD_D7	YCD_D6	YCD_D5	YCD_D4	YCD_D3	YCD_D2	YCD_D1	YCD_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YC position dot register indicates the Y dot position of point C where calibration takes place. This register will be functionally enhanced in future. Don't access this register.

6.4.14 XA Position A/D Register (XAPAR)

Address: 0x0038 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	XAA_D11	XAA_D10	XAA_D9	XAA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XAA_D7	XAA_D6	XAA_D5	XAA_D4	XAA_D3	XAA_D2	XAA_D1	XAA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XA position A/D register indicates the X position A/D conversion result of point A subject to calibration/

6.4.15 YA Position A/D Register (YAPAR)

Address: 0x003A Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	YAA_D11	YAA_D10	YAA_D9	YAA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YAA_D7	YAA_D6	YAA_D5	YAA_D4	YAA_D3	YAA_D2	YAA_D1	YAA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YA position A/D register indicates the Y position A/D conversion result of point A subject to calibration.

6.4.16 XB Position A/D Register (XBPAR)

Address: 0x003C Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	XBA_D11	XBA_D10	XBA_D9	XBA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XBA_D7	XBA_D6	XBA_D5	XBA_D4	XBA_D3	XBA_D2	XBA_D1	XBA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XB position A/D register indicates the X position A/D conversion result of point B subject to calibration.

6.4.17 YB Position A/D Register (YBPAR)

Address: 0x003E Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	YBA_D11	YBA_D10	YBA_D9	YBA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YBA_D7	YBA_D6	YBA_D5	YBA_D4	YBA_D3	YBA_D2	YBA_D1	YBA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YB position A/D register indicates the Y position A/D conversion result of point B subject to calibration.

6.4.18 XC Position A/D Register (XCPAR)

Address: 0x0040 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	XCA_D11	XCA_D10	XCA_D9	XCA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XCA_D7	XCA_D6	XCA_D5	XCA_D4	XCA_D3	XCA_D2	XCA_D1	XCA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The XC position A/D register indicates the X position A/D conversion result of point C subject to calibration. This register will be functionally enhanced in future. Don't access this register.

6.4.19 YC Position A/D Register (YCPAR)

Address: 0x0042 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	YCA_D11	YCA_D10	YCA_D9	YCA_D8
R	R	R	R	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YCA_D7	YCA_D6	YCA_D5	YCA_D4	YCA_D3	YCA_D2	YCA_D1	YCA_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The YC position A/D register indicates the Y position A/D conversion result of point C subject to calibration. This register will be functionally enhanced in future. Don't access this register.

6.4.20 DX Dot Register (DXDR)

Address: 0x0044 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
DX1_D15	DX1_D14	DX1_D13	DX1_D12	DX1_D11	DX1_D10	DX1_D9	DX1_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
DX1_D7	DX1_D6	DX1_D5	DX1_D4	DX1_D3	DX1_D2	DX1_D1	DX1_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The DX dot register holds a value obtained by multiplying the number of dots per data (X position A/D conversion result at calibration) by 1,000. The power supply controller outputs a dot position of the X position to be stored in the X position dot register (XPDR) from the values set in the DX dot register (DXDR), XA position dot register (XAPDR) and XA position A/D register (XAPAR). When the DX dot register (DXDR) has been set to “0,” the dot position is not calculated.

6.4.21 DY Dot Register (DYDR)

Address: 0x0046 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
DY1_D15	DY1_D14	DY1_D13	DY1_D12	DY1_D11	DY1_D10	DY1_D9	DY1_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
DY1_D7	DY1_D6	DY1_D5	DY1_D4	DY1_D3	DY1_D2	DY1_D1	DY1_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The DY dot register (DY1DR) holds a value obtained by multiplying the number of dots per data (Y position A/D conversion result at calibration) by 1,000. The power supply controller outputs a dot position of the Y position to be stored in the Y position dot register (YPDR) from the values set in the DY dot register (DYDR), YA position dot register (YAPDR) and YA position A/D register (YAPAR). When the DY dot register (DY1DR) has been set to “0,” the dot position is not calculated.

6.4.22 X Position Dot Calculation A/D Value (XPARDOT)

Address: 0X0048 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	XD_D9	XD_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
XD_D7	XD_D6	XD_D5	XD_D4	XD_D3	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The X position dot calculation A/D value register (XPARDOT) holds an AD value of X position dot calculation. This A/D value is obtained by calculating the mean of the previous four XPARDOT values and clearing the low order 3 bits with zeros.

6.4.23 X Position Dot Calculation A/D Value 1 (XPARDOT1)

Address: 0x004A Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	XD1_D9	XD1_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

YD3_D7	YD3_D6	YD3_D5	YD3_D4	YD3_D3	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The Y position dot calculation A/D value 3 register (YPARDOT3) holds a YPARDOT value before sampling.

6.4.31 Y Position Dot Calculation A/D Value 4 (YPARDOT4)

Address: 0x005A Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	0	YD4_D9	YD4_D8
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

D7	D6	D5	D4	D3	D2	D1	D0
YD4_D7	YD4_D6	YD4_D5	YD4_D4	YD4_D3	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The Y position dot calculation A/D value 4 register (YPARDOT4) holds a YPARDOT value before sampling.

6.4.32 RTC/Touch Panel/Key Input/Power Supply Status Register (RTKISR)

This status register indicates the RTC, touch panel, or key input status. Below is a brief description of the status bits related to the touch panel.

Address: 0x0090 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	IRRIF	POWERIF	KEYIF	TPIF	RTCIF
R	R	R	R/W	R/W	R/W	R/W	R/W

(1) TPIF

TPIF bit	Setting
0	The PEN_ONIF, PEN_OFFIF, CAIF and CAEF bits of the touch panel status registered are all set to “0.’’ (Initial value)
1	One of the PEN_ONIF, PEN_OFFIF, CAIF and CAEF bits of the touch panel status register is set to “1.’’ [Clear condition] “0’’ is written with the TPIF bit set to “1.’’

6.4.33 Touch Panel Calibration Method (2-point System)

The power supply controller supports 2-point touch panel calibration. Figure 6.11shows the points of the drawing coordinates and A/D conversion coordinates that are necessary for calibration.

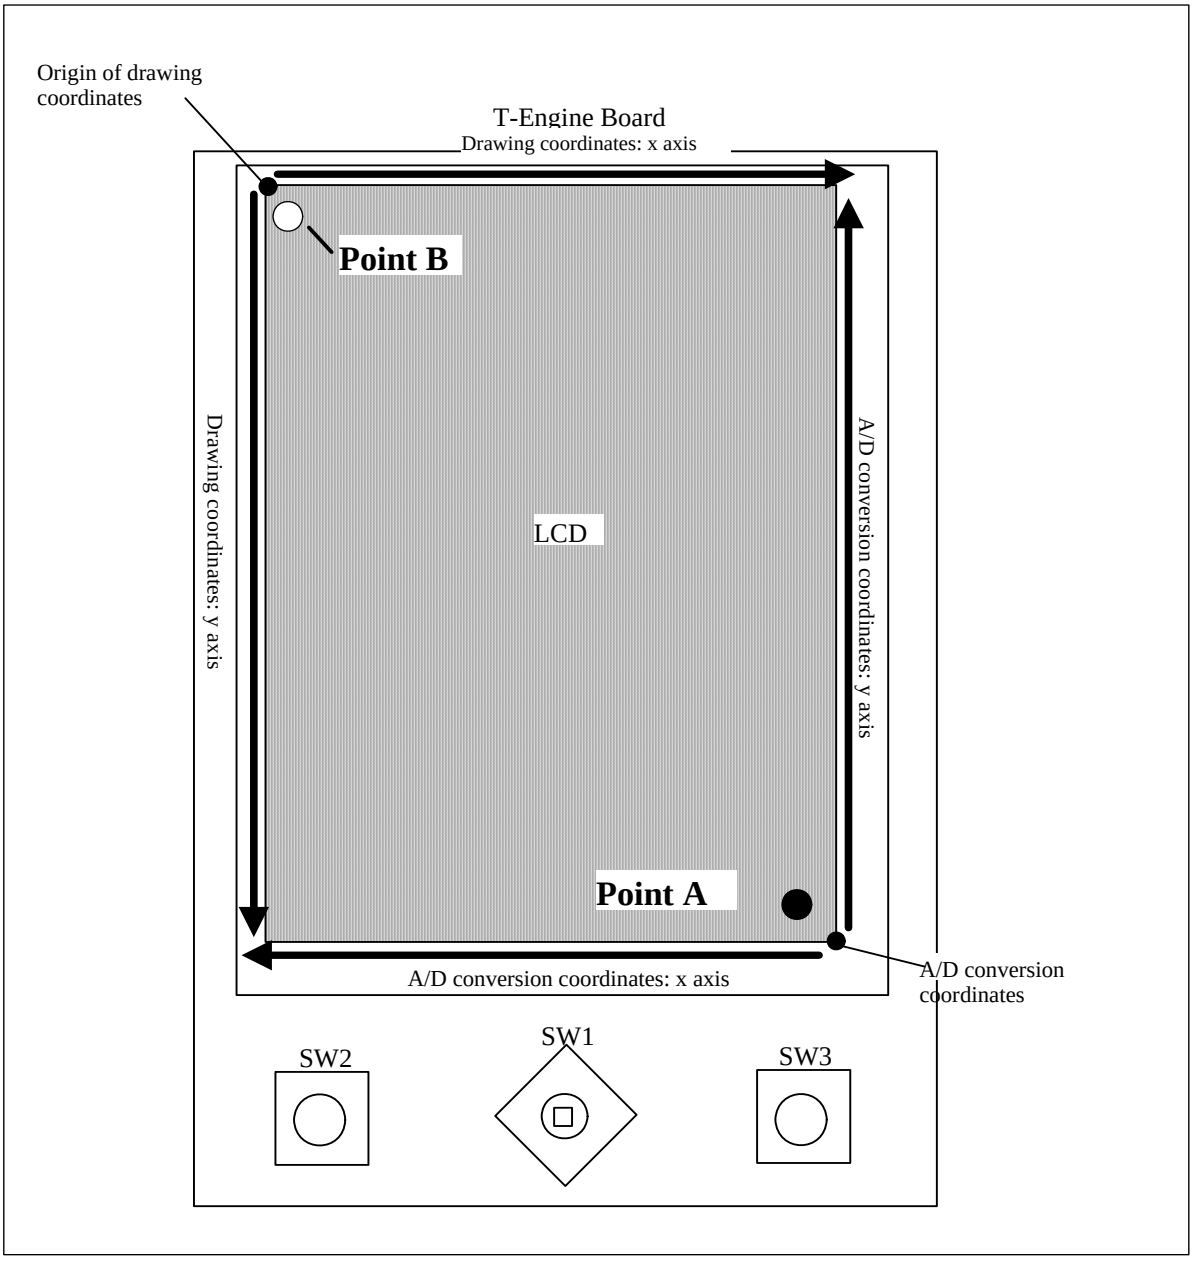

Figure 6.11 Points of the Drawing Coordinates and A/D Conversion Coordinates

[Calibration Method]

(1) The SH7760 writes the dot points of points A and B to the registers XAPDR, YAPDR, XBPDR, and YBPDR.

(2) When point A is pen-touched, it is signaled by a pen touch interrupt. The A/D conversion result of the pen-touched point A is written to the registers XAPAR and YAPAR.

(3) Next, when point B is pen-touched, it is signaled by a pen touch interrupt. The A/D conversion result of the pen-touched point B is written to the registers XBPAR and YBPAR.

(4) Calibration takes place according to data in the above steps (1) to (3). Using the following expression, the SH7760 calculates the number of dots per data of the X position A/D conversion result and that of the Y position A/D conversion result.

Number of dots per data of the X position A/D conversion result (DX)

DX = (DXA – DXB) / (TXB – TXA) Where TXA < TXB, DXA > DXB

Number of dots per data of the Y position A/D conversion result (DY)

DY = (DYA – DYB) / (TYB- TYA) Where TYA < TYB, DYA > DYB

DXA: X position drawing dot point of point A (XAPDR)
DXB: X position drawing dot point of point B (XBPDR)
TXA: X position A/D conversion result of point A (XAPAR)
TXB: X position A/D conversion result of point B (XBPAR)
DYA: Y position drawing dot point of point A (YAPDR)
DYB: Y position drawing dot point of point B (YBPDR)
TXA: Y position A/D conversion result of point A (YAPAR)
TXB: Y position A/D conversion result of point B (YBPAR)

(5) The above calculation results are multiplied by 1,000, their decimal places are rounded, and the resulting integers are written to the registers DXDR and DYDR.

DX dot register (DXDR) = DX x 1,000 (rounding the decimal places)

DY dot register (DYDR) = DY x 1,000 (rounding the decimal places)

(6) The power supply controller uses data stored in the registers DXDR, DYDR, XAPDR, YAPDR, XAPAR, and YAPAR to calculate dot position data (XPDR, YPDR) of the pen-touched point on the LCD. The power supply controller uses the following expression to calculate dot position data.

X position dot register (XPDR)

XPDR = (DXA – (DX x (TXD – TXA)) / 1,000

Y position dot register (YPDR)

YPDR = (DYA – (DY x (TYD – TYA)) / 1,000

DXA: XA position dot register (XAPDR) data
DX: DX1 dot register (DXDR) data
TXA: XA position A/D register (XAPAR) data
TXD: X position A/D register (XPAR) data
DYA: YA position dot register (YAPDR) data
DY: DY dot register (DYDR) data
TYA: YA position A/D register (YAPAR) data
TYD: X position A/D register (YPAR) data

The power supply controller outputs data stored in the X position A/D register (XPAR) and Y position A/D register (YPAR). When the values stored in the DX dot register (DXDR) and DY dot register (DYDR) are not 0, the power supply controller outputs the data derived from the above expressions to the X position dot register (XPDR) and Y position dot register (YPDR). When either value is 0, it does not use the above expression for calculation and outputs only XPAR and YPAR data.

6.5 Key Switch Control

Figure 6.12 shows the T-Engine switches under control by the power supply controller. The power supply controller controls the switches SW1 to SW3 on the CPU board and the switches SW1to SW3 on the LCD board.

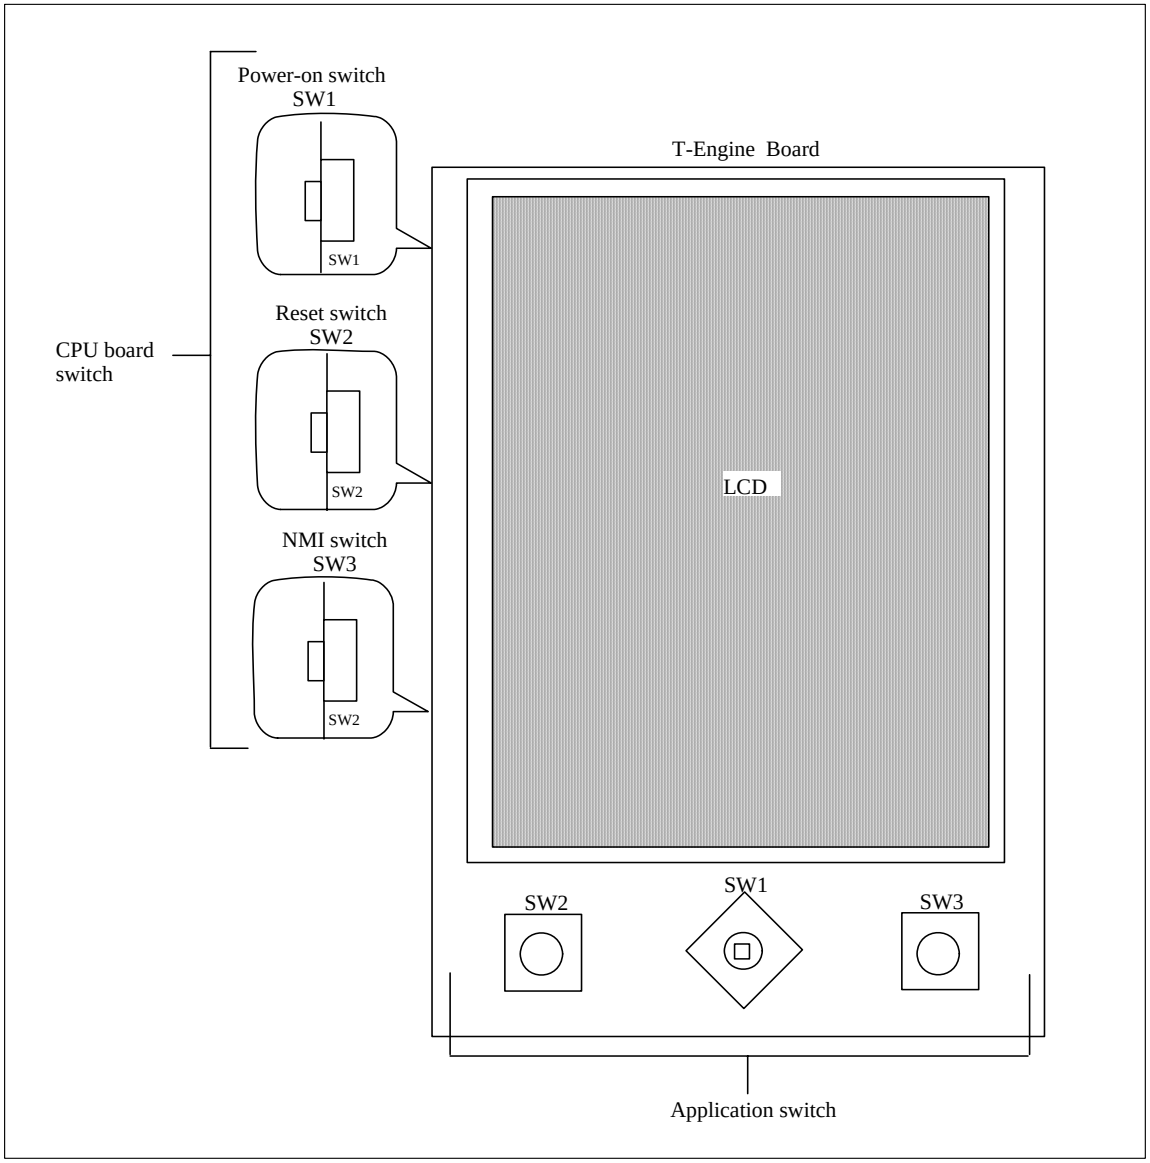

Figure 6.12 T-Engine Switch

6.5.1 CPU Board Switch Control

(1) Power-on switch (SW1)

- When T-Engine is OFF, it is turned ON if the power-on switch is pressed and held for 0.5 seconds or more.
- When T-Engine is ON, it is turned OFF if the power-on switch is pressed and held for 2 seconds or more.

(2) Reset switch (SW2)

T-Engine is turned OFF when the reset switch is pressed.

(3) NMI switch (SW3)

An NMI interrupt occurs for the SH7760 when the NMI switch is pressed.

6.5.2 LCD Board Switch Control (Application Switch)

(1) Cursor switch (SW1) and push-button switches (SW2 and SW3) on the LCD board

- The cursor switch and push-button switches are subject to sampling at intervals of 10msec. When consecutive three samplings indicate that the same key is being pressed, key bit pattern data of the cursor switch and push-button switches are output.
- If the switch is turned ON, a key ON interrupt occurs. If the switch is turned OFF, a key OFF interrupt occurs.
- When the same switch is pressed and held, an auto repeat interrupt occurs at intervals of 100 to 450msec (unit: 50msec).

6.5.3 Key Switch Registers

Table 6.5 summarizes the key switch registers. For details of each register, refer to 6.5.4 to 6.5.8.

Table 6.5 Key Switch Registers

Register	Abbreviation	Address	R/W	Size	Remarks
Key control register	KEYCR	0x0060	R/W	1 byte	
Key auto repeat time register	KATIMER	0x0061	R/W	1 byte	
Key bit pattern register	KBITPR	0x0064	R/W	2 bytes	
Key input status register	KEYSR	0x0062	R/W	1 byte	
RTC/Touch panel/key input/Power supply status register	RTKISR	0x0090	R/W	1 byte	

6.5.4 Key Control Register (KEYCR)

Address: 0x0060 Initial value: 0x20

D7	D6	D5	D4	D3	D2	D1	D0
0	0	NMIE	PONSWI	ARKEYI	KEY_OFFI	KEY_ONI	KEY_STR
R	R	R/W	R/W	R/W	R/W	R/W	R/W

(1) KEY_STR

KEY_STR bit	Setting
0	An application switch key input is disabled. (Initial value)
1	An application switch key input is enabled.

(2) KEY_ONI

KEY_ONI bit	Setting
0	An application switch ON interrupt is disabled. (Initial value)
1	An application switch key ON interrupt is enabled.

(3) KEY_OFFI

KEY_OFFI bit	Setting
0	An application switch OFF interrupt is disabled. (Initial value)
1	An application switch key OFF interrupt is enabled.

(4) ARKEYI

ARKEYI bit	Setting
0	An application switch auto repeat interrupt is disabled. (Initial value)
1	An application switch auto repeat interrupt is enabled.

(5) PONSWI

PONSWI bit	Setting
0	A power-on switch interrupt is disabled. (Initial value)
1	A power-on switch interrupt is enabled.

(6) NMIE

NMIE bit	Setting
0	An NMI interrupt is disabled for the SH7760 even when the NMI switch is pressed.
1	An NMI interrupt is disabled for the SH7760 when the NMI switch is pressed. (Initial value)

6.5.5 Key Auto Repeat Time Register (KATIMER)

Address: 0x0061 Initial value: 0x01

D7	D6	D5	D4	D3	D2	D1	D0
450msec	400msec	350msec	300msec	250msec	200msec	150msec	100msec
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

This register sets the auto repeat interrupt generation time. The auto repeat interrupt generation time is set at intervals of 100msec to 450msec (unit: 50msec). When one of the bits (100msec to 450msec) is set, the corresponding auto repeat interrupt generation time is set.

6.5.6 Key Bit Pattern Register (KBIPR)

Address: 0x0064 Initial value: 0x0000

D15	D14	D13	D12	D11	D10	D9	D8
0	0	0	0	0	SW2	0	SW3
R	R	R	R	R	R	R	R

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	SW1-5 (Decided)	SW1-4 (↓)	SW1-3 (↑)	SW1-2 (←)	SW1-1 (→)
R	R	R	R	R	R	R	R

This register stores the bit pattern of the application switch (SW1 to SW3) key input status.

(1) SWn

SWn bit	Setting
0	Application switch key input: OFF (Initial value)
1	Application switch key input: ON

6.5.7 Key Input Status Register (KEYSR)

Address: 0x0062 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	PONSWF	ARKEYF	KEY_OFFF	KEY_ONF	0
R	R	R	R/W	R/W	R/W	R/W	R

(1) KEY_ONF

KEY_ONF bit	Setting
0	An application switch key has not been turned on (Initial value)
1	An application switch key has been turned on. At this time, if the KEY_ONI bit is set to ‘’1,’’ a key ON interrupt occurs. [Clear condition] “0’’ is written with the KEY_ONF bit set to ‘’1.’’

(2) KEY_OFFF

KEY_OFFF bit	Setting
0	An application switch key is ON or OFF. (Initial value)
1	An application switch key has changed from ON to OFF. (Initial value) At time, if the KEY_OFFI bit is set to “1,’’ a key OFF interrupt occurs. [Clear condition] “0’’ is written with the KEY_OFFI bit set to ‘’1.’’

(3) ARKEYF

ARKEYF bit	Setting
0	The same application switch key is not ON for the time specified in the key auto repeat time register (Initial value)
1	The same application switch key is not ON for the time specified in the key auto repeat time register. At this time, if the ARKEYI bit is set to ‘’1,’’ repeat interrupt occurs. [Clear condition] ‘’0’’ is written with the ARKEYF bit set to “1.’’

(4) PONSWF

PONSWF bit	Setting
0	The power-on switch has not been turned on for 2sec or more.
1	The power-on switch has been turned on for 2 sec or more. At this time, if the PONSWI bit is set to “1,” a power-on interrupt occurs. [Clear condition] “0” is written to the PONSWF bit set to “1.”

[Supplementary description on application switch key input]

(1) When multiple keys are pressed at the same time, the corresponding bits are all set to “1,” and a KEY_ONF interrupt occurs so long as it is enabled.

(2) If data in the key bit pattern register changes when multiple keys are pressed at the same time, a KEY_ONF interrupt occurs so long as it is enabled.

- Example -

This KEY_ONF interrupt occurs when the state with switches SW1 and SW2 pressed simultaneously changes to one with switches SW1 and SW3 pressed simultaneously.

(3) When multiple keys are released in the state with the keys pressed and held, a KEY_OFFI interrupt occurs so long as it is enabled.

(4) When multiple keys are released, the key states immediately before key release are retained in the key bit pattern register.

6.5.8 RTC/Touch Panel/Key Input/Power Supply Status Register (RTKISR)

This status register indicates the RTC, touch panel, or key input status. Below is a brief description of the status bits for key input.

Address: 0x0090 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	IRRIF	POWERIF	KEYIF	TPIF	RTCIF
R	R	R	R/W	R/W	R/W	R/W	R/W

(1) KEYIF

KEYIF bit	Setting
0	The PONSWF, ARKEYF, KEY_OFFF, and KEY_ONF bits of the key input status register are all set to “0.” (Initial value)
1	One of the PONSWF, ARKEYF, KEY_OFFF, or KEY_ONF bits of the key input status register is set to “1.” [Clear condition] “0” is written with the KEYIF bit set to “1.”

6.6 Power Supply Control

This section describes the power supply control functions. Table 6.6 summarizes the power supply control registers. In addition, refer to 6.6.1 to 6.6.3 for details of each register.

(1) T-Engine is turned ON or OFF.
(2) When T-Engine is OFF, it is turned ON if the power-on switch is pressed for 2 seconds or more.
(3) T-Engine can be turned OFF from the SH7760.
(4) If the DIP switch (SW7) is set to ON, T-Engine is also turned ON at the same time the power supply controller is turned ON.

Table 6.6 Power Control Registers

Register	Abbreviation	Address	R/W	Size	Remarks
System power control register 1	SPOWCR1	0x0070	R/W	1 byte	
System power control register 2	SPOWCR2	0x0071	R/W	1 byte	

6.6.1 System Power Control Register 1 (SPOWCR1)

Address: 0x0070 Initial value: 0x01

R	R	R	R	R	R	R	R/W

(1) SPOWER

SPOWER bit	Setting
0	System power supply: OFF
1	System power supply: ON (Initial value)

6.6.2 System Power Control Register 2 (SPOWCR2)

Address: 0x0071 Initial value: 0x01

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	SFPOWER
R	R	R	R	R	R	R	R/W

(2) SFPOWER

SFPOWER	Setting
0	T-Engine is turned OFF by SH7760 control.
1	T-Engine is turned OFF by pressing the power-on switch. (Initial value)

6.6.3 RTC/Touch Panel/Key Input/Power Supply Status Register (RTKISR)

This status register indicates the RTC, touch panel, or key input status. Below is a brief description of the status bits for power control.

Address: 0x0090 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	IRRIF	POWERIF	KEYIF	TPIF	RTCIF
R	R	R	R/W	R/W	R/W	R/W	R/W

(1) POWERIF

This bit will be functionally enhanced in the future. Don't access this register. When read, this bit is always 0."

6.7 LCD Front Light Control

This section describes the LCD light control functions. In addition, Table 6.7 summarizes the front light control registers.

(1) Controlling the ON/OFF state of the LCD front light

Table 6.7 LCD front light register

Register	Abbreviation	Address	R/W	Size	Remarks
LCD front light register	LCDR	0x00A1	R/W	1 byte	

6.7.1 LCD Front Light Register (LCDR)

Address: 0x00A1 Initial value: 0x01

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	FRONTL
R	R	R	R	R	R	R	R/W

(1) FRONTL

FRONTL bit	Setting
0	The LCD front light is turned OFF.
1	The LCD front light is turned ON. (Initial value)

6.8 Reset Control

This section describes the reset control functions. Table 6.8 summarizes the reset control registers.

(1) T-Engine reset is controlled.

Table 6.9 Reset Registers

Register	Abbreviation	Address	R/W	Size	Remarks
Reset control register	RESTCR	0x00A2	R/W	1byte	

6.8.1 RESTCR Register (RESTCR)

Address: 0x00A2 Initial value: 0x02

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	SWRES	SORES
R	R	R	R	R	R	R/W	R/W

(1) SORES

SORES bit	Setting
0	T-Engine is not restarted by reset. (Initial value)
1	T-Engine is restarted by reset.

If this bit is set to “1,” T-Engine is restarted.

(2) SWRES

SWRES bit	Setting
0	Devices other than the power supply controller are reset with the reset switch (SW2).
1	All the devices covering the power supply controller are reset with the reset switch (SW2). (Initial value)

6.9 Infrared Remote Control

This section describes the infrared remote control functions. Table 6.9 summarizes the infrared remote control functions. For details of each register, refer to 6.9.1 to 6.9.8.

(1) Support of formats for two kinds of infrared remote control signal

Supported format: NEC format and Home Appliance Manufacturer's Association format

(2) Function for receiving infrared remote control signals

A maximum of 255 bytes of the infrared remote control signal can be stored. Receive data can be read from the receiving FIFO data register (IRRRFDR).

Infrared remote control signals of a specified format can be received.

When a frame signal has been received, a receiving interrupt may be generated.

(3) Function for transmitting infrared remote control signals

A maximum of 255 bytes of the infrared remote control signal can be transmitted.

Transmit data can be written to the transmitting FIFO data register (IRRSFDR).

Infrared remote control signals of the specified format are transmitted.

Table 6.9 Infrared Remote Control Registers

Register	Abbreviation	Address	R/W	Size
Infrared remote control register	IRRCR	0x00B0	R/W	1 byte
Infrared remote status register	IRRSR	0x00B1	R/W	1 byte
Receive data count register for infrared remote control signals	IRRRDNR	0x00B2	R	1 byte
Transmit data count register for infrared remote control signals	IRRSDNR	0x00B3	R	1 byte
Receive FIFO data register for infrared remote control signals	IRRRFDR	0x00B4	R	1 byte
Transmit FIFO data register for infrared remote control signals	IRRSFDR	0x00B5	W	1 byte

6.9.1 Infrared Remote Control Register (IRRCR)

Address; 0x00B0 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	TDIE	RDIE	FORMAT	START
R	R	R	R	R/W	R/W	R/W	R/W

(1) START

START bit	Setting
0	Infrared remote control is disabled. (Initial value)
1	Infrared remote control is enabled to start data transmission/reception.

(2) FORMAT

FORMAT bit	Setting
0	The NEC format is set. (Initial value)
1	The Home Appliance Manufacturer's Association format is set.

(3) RDIE

RDIE bit	Setting
0	An interrupt is disabled upon completion of receiving a frame of infrared remote control signal. (Initial value)
1	An interrupt is enabled upon completion of receiving a frame of infrared remote control signal.

(4) TDIE

TDIE bit	Setting
0	An interrupt is disabled upon completion of transmitting a frame of infrared remote control signal. (Initial value)
1	An interrupt is enabled upon completion of transmitting a frame of infrared remote control signal.

6.9.2 Infrared Remote Control Status Register (IRRSR)

Address: 0x00B1 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	TDI	RDI	0	RDBFER
R	R	R	R	R/W	R/W	R	R/W

(1) RDBFER

RDBFER bit	Setting
0	A buffer full error has not occurred during a receive operation. (Initial value)
1	A buffer full error has occurred during a receive operation.

(2) RDI

RDI bit	Setting
0	A frame of data has not been received. (Initial value)
1	A frame of data has been received. [Clear condition] “0” is written with the RDI bit set to “1.”

(3) TDI

TDI bit	Setting
0	A frame of data has not been transmitted. (Initial value)
1	A frame of data has been transmitted. [Clear condition] “0” is written with the TDI bit set to “1.”

6.9.3 Receive Data Count Register for Infrared Remote Control Signals (IRRRDNR)

Address: 0x00B2 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
IRRRD_D7	IRRRD_D6	IRRRD_D5	IRRRD_D4	IRRRD_D3	IRRRD_D2	IRRRD_D1	IRRRD_D0
R	R	R	R	R	R	R	R

This register indicates the number of received data items (infrared remote control signals) stored in the receive FIFO register. When this register is “0x00,” it indicates that there is no data. When the value of this register is “0xFF,” it indicates that the receive FIFO register is full of data.

6.9.4 Transmit Data Count Register for Infrared Remote Control Signals (IRRSDNR)

Address: 0x00B3 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
IRRSD_D7	IRRSD_D6	IRRSD_D5	IRRSD_D4	IRRSD_D3	IRRSD_D2	IRRSD_D1	IRRSD_D0
R	R	R	R	R	R	R	R

This register indicates the number of data items not transmitted (infrared remote control signals) stored in the transmit FIFO register. When the value of this register is “0x00,” it indicates that there is no data. When the value of this register is “0xFF,” it indicates that the transmit FIFO buffer is full of data.

6.9.5 Receive FIFO Data Register for Infrared Remote Control Signals (IRRRFDR)

Address: 0x00B4 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
IRRRDR_D7	IRRRDR_D6	IRRRDR_D5	IRRRDR_D4	IRRRDR_D3	IRRRDR_D2	IRRRDR_D1	IRRRDR_D0
R	R	R	R	R	R	R	R

This register is an 8-bit FIFO register for storing received data. All the received data can be obtained from this register until it is emptied. For details, refer to 6.9.8, “Infrared Remote Control Data Structure.”

6.9.6 Transmit FIFO Data Register for Infrared Remote Control Signals (IRRSFDR)

Address: 0x00B5 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
IRRSDR_D7	IRRSDR_D6	IRRSDR_D5	IRRSDR_D4	IRRSDR_D3	IRRSDR_D2	IRRSDR_D1	IRRSDR_D0
W	W	W	W	W	W	W	W

This register is an 8-bit FIFO register that stores transmission data. Transmission data can be stored until this register is filled with data. For details, refer to 6.9.8, “Infrared Remote Control Data Structure.”

6.9.7 RTC/Touch Panel/Key Input/Power Supply Status Register (RTKISR)

This status register indicates the RTC, touch panel, or key input status. Below is a brief description of the status bits for infrared remote control signals.

Address: 0x0090 Initial value: 0x00

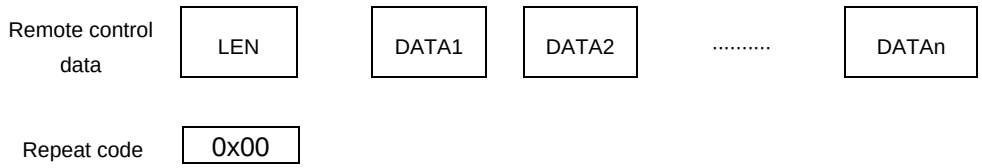
D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	IRRIF	POWERIF	KEYIF	TPIF	RTCIF
R	R	R	R/W	R/W	R/W	R/W	R/W

(1) IRRIF

IRRIF bit	Setting
0	A frame of data has not been transmitted or received. (Initial value)
1	A frame of data has been transmitted or received. [Clear condition] "0" is written with the IRRIF bit set to "1."

6.9.8 Infrared Remote Control Data Structure

The following shows the relation between the infrared remote control data and repeat codes. In addition, it shows a structure of remote control data in the NEC format.



Example) NEC format remote control data

[Infrared Remote Control Operation Procedure]

[Initial setting]

(1) Two kinds of formats are set by selecting the FORMAT bit of the IRRCR register.
(2) The START bit of the IRRCR register is set to "1" to start infrared remote control and infrared signal reception
(3) To enable an interrupt at the time of receiving a frame of the signal, the RDIE bit is set to "1."
(4) To enable an interrupt at the time of transmitting a frame of the signal, the TDIE bit is set to "1."

[For infrared signal reception]

(1) When a frame of data has been received (RDI=1), the IRRIF bit of the RTKISR register is set to "1."
(2) When an interrupt at completion of signal reception has been enabled (RDIE=1), an interrupt occurs when a frame of data is stored in the IRRRFDE register.
(3) To obtain the received data, the receiving FIFO data register (IRRRFDR) is read. The IRRRFDR register contains a data count (that indicates the number of items of one frame of data received) and the received data itself. If this register is read, the data count and data itself are output in this order.
(4) The size of received data is set in the received data count register (IRRRDNR). When two frames have been received, the total data count and the two frames of data are set in the received data count register (IRRRDNR).

[For infrared signal transmission]

(1) When transmission data is transmitted, it is written to the transmitting FIFO data register. The data count for one frame of transmission data and the data itself are written to this data register. In addition, this transmission data count is not counted as transmission data.
(2) The count for data not transmitted is set in the transmission data count register (IRRSDNR).
(3) Data can be written to the transmission data IRRSFDR until the count for data not transmitted (IRRSDNR) reaches 255.
(4) When a frame of data has been transmitted (TDI=1), the IRRIF bit of the RTKISR register is set to “1.” An interrupt for transmission completion occurs so long as it is enabled.

⚠ CAUTION

- To change the type of format, the FORMAT value of the same register must be set before the START bit of the IRRCR register is set to “1.”
- When the START bit of the IRRCR register is “0,” transmission/reception is not guaranteed.
- When the specified size is larger than the IRRRDNR value during a read operation, “FF” is set for excessive read data.
- Only the custom code and data code are specified for transmission data, and the leader, stop bit, frame space, and trailer are automatically added.
- When the number of write data items is larger than that of the remaining transmission data (255–byte transmission data count register IRRSDNR), a data length error occurs.
- When the IRRRFDR register has become full during a read operation, the buffer full error bit is set to “1,” and the data received later is discarded.
- The IRRIF bit of the RTKISR register is cleared when “0” is written with the IRRIF bit set to “1.”

6.10 Serial EEPROM Control

This section describes the EEPROM control functions. Table 6.10 summarizes the serial EEPROM control registers. For details of each register, refer to 6.10.1 to 6.10.3.

(1) Serial EEPROM (512 bytes) can be read and written.

Table 6.10 Serial EEPROM Control Registers

Register	Abbreviation	Address	R/W	Size
EEPROM control register	EEPCR	0x00C0	R/W	1 byte
EEPROM data register	EEPDR	0x0100~0x02FF	R/W	1 byte x 512

6.10.1 EEPROM Control Register (EEPCR)

Address: 0x00C0 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	START
R	R	R	R	R	R	R	R/W

(1) START

START bit	Setting
0	The serial EEPROM is disabled. (Initial value)
1	The serial EEPROM is enabled.

6.10.2 EEPROM Data Register (EEPDR)

Address: 0x0100 to 0x02FF Initial value: Not defined

D7	D6	D5	D4	D3	D2	D1	D0
EEPDR_D7	EEPDR_D6	EEPDR_D5	EEPDR_D4	EEPDR_D3	EEPDR_D2	EEPDR_D1	EEPDR_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

This register consists of 512 8-bit data in the above format.

EEPDR address	
0x0100	8 bit
0x0101	8 bit
	-
	-
	-
0x02FE	8 bit
0x02FF	8 bit

An EEPROM address corresponds to an EEPDR address. When a read/write operation is performed on the EEPROM, the EEPDR address must be specified for the operation.

6.10.3 Serial EEPROM Operation Procedure

[Initial Setting]

(1) The START bit of the EEPCR register is set to “1.”

[For a read/write operation to the serial EEPROM]

(1) An EEPDR address corresponding to an EEPROM address must be specified for a read/write operation.

⚠ CAUTION

When the START bit of the EEPCR register is “0,” read/write data is not guaranteed.

6.11 Electronic Volume Control

This section describes the electronic volume control functions. Table 6.11 summarizes the electronic volume control registers. For details of each register, refer to 6.11.1 and 6.11.2.

(1) An electronic volume value can be set.

An electronic volume value can be set within a range from 0x00 (minimum sound volume) to 0xFF (maximum sound volume).

(2) Two electronic volume values can be set.

An electronic volume value can be set for the right or left speaker.

Table 6.11 Electronic Volume Control Registers

Register	Abbreviation	Address	R/W	Size
Electronic volume data register for the right speaker	EVRDR	0x00D0	R/W	1 byte
Electronic volume data resister for the left speaker	EVLDR	0x00D1	R/W	1 byte

6.11.1 Electronic Volume Data Register for the Right Speaker (EVRDR)

Address: 0x00D0 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
EVRDR_D7	EVRDR_D6	EVRDR_D5	EVRDR_D4	EVRDR_D3	EVRDR_D2	EVRDR_D1	EVRDR_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Values from 0x00 to 0xFF can be set.

6.11.2 Electronic Volume Data Register for the Left Speaker (EVLDR)

Address: 0x00D1 Initial value: 0x00

D7	D6	D5	D4	D3	D2	D1	D0
EVLRD_D7	EVLRD_D6	EVLDR_D5	EVLDR_D4	EVLDR_D3	EVLDR_D2	EVLDR_D1	EVLDR_D0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Values from 0x00 to 0xFF can be set.

6.12 Power Supply Controller Initial Values

The register values for the power supply controller vary depending on the following conditions. Under condition A, all the power supply controller registers are initialized. The initial value of each register is given in the description of each register in this manual.

For register values under conditions A to D, refer to the following table of RTC registers.

[Condition]

Condition A: The power is turned ON.
The hard reset switch (SW4) is pressed.

Condition B: The power is turned ON.
The RESTCR SORES bit has been set to “1.”
The RESTCR SWRES bit has been set to “1,” and the reset switch (SW2) has been pressed.

Condition C: The RESTCR SWES bit has been cleared to zero and the reset switch (SW2) has been pressed.

Condition D: The SPOWCR1 SPOWER bit has been set to “0.”

Table 6.12 Values under RTC Register Conditions

Register	Abbreviation	Condition A	Condition B	Condition C	Condition D
RTC control register	RTCCR	Initial value	Initial value	Hold	Initial value
RTC status register	RTCSR	Initial value	Hold	Hold	Hold
Second counter	SECCNT	Initial value	Operation	Operation	Operation

7. External Interrupts

7.1 SH7760 External Interrupts

Figure 7.1 shows a mechanism for the SH7760 interrupt signal.

Table 7.1 shows the levels for respective interrupt signals.

As shown in Figure 7.1, interrupt signals from devices within T-Engine are converted into the /IRL signals by FPGA, then output to the /IRL [3:0] of the SH7760.

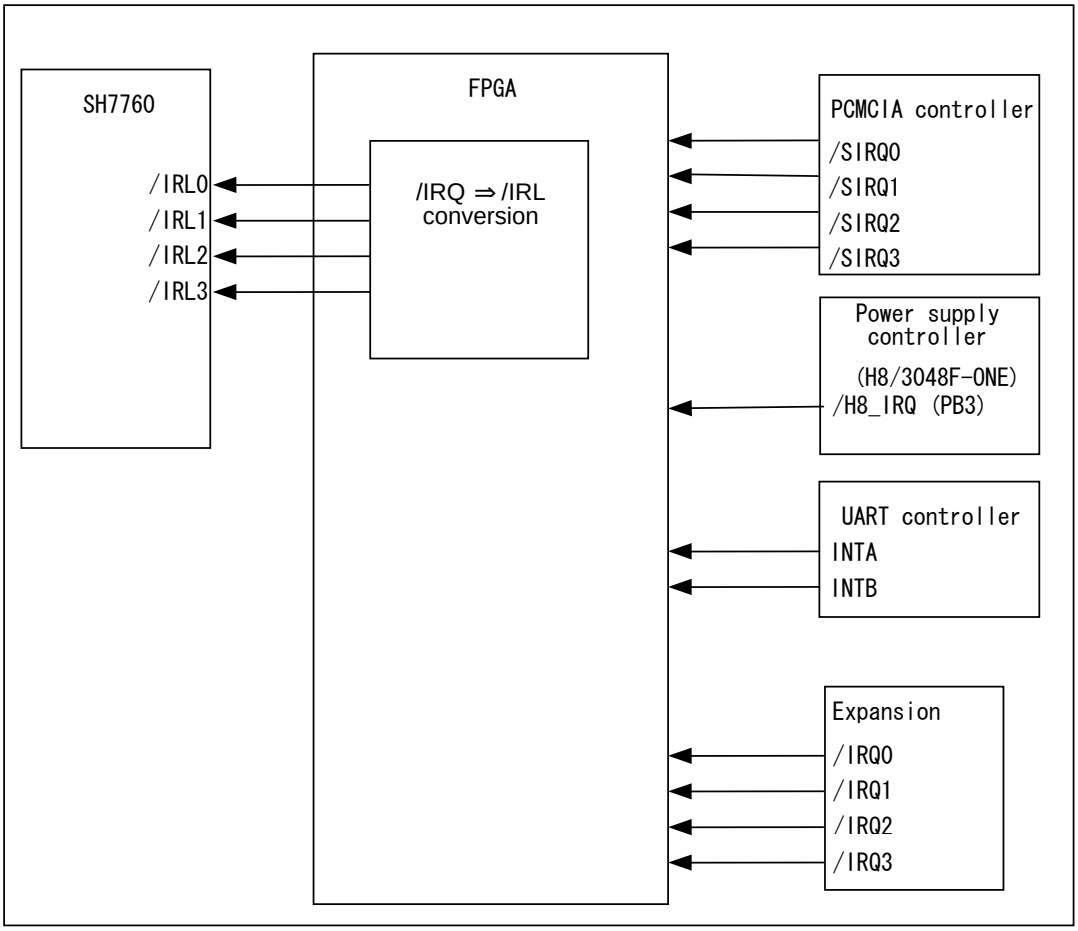

Figure 7.1 Interrupt Signal Mechanism

Table 7.1 Interrupt Levels for Interrupt Signals

No.	Interrupt request source	Interrupt input pin	Interrupt signal level	Remarks
1	PCMCIAcontroller (SIRQ3)	/IRL [3:0]	/IRL [3:0] = 0001	Interrupt level 14
2	PCMCIAcontroller (SIRQ2)	/IRL [3:0]	/IRL [3:0] = 0101	Interrupt level 10
3	PCMCIAcontroller (SIRQ1)	/IRL [3:0]	/IRL [3:0] = 1000	Interrupt level 7
4	PCMCIAcontroller (SIRQ0)	/IRL [3:0]	/IRL [3:0] = 1010	Interrupt level 5
5	UART controller chA	/IRL [3:0]	/IRL [3:0] = 0110	Interrupt level 9

: Indicates the address bus, data bus, control signals, and serial signals of the SH7760. Supply voltage is 3.3V.

*1: 5.0V (typ.) is supplied when the SH7760 is turned on.

*2: If this pin is set to “Low,” output takes place from the SH7760 expansion to the expansion slot.

*3: 3.3V (typ.) is supplied when the battery is provided or the AC adapter is connected.

*4: 3.3V (typ.) is supplied when the SH7760 is turned on.

*5: Pin for power supply (4.0V to 5.6V). T-Engine can be powered via the expansion slot.

9. Daughter Board Design Guide

This chapter describes the design of the daughter board to be connected to the extension slot of T-Engine. The daughter board may contain user-specific devices and can be controlled by the address bus, data bus, and control signals or serial signals (start-stop) of the SH7760 that connect to the extension slots of T-Engine.

9.1 Daughter Board Dimensions

The recommended daughter board size is the CPU board size (120mm x 75mm) of T-Engine.

9.2 Daughter Board Power Supply

Table 9.1 shows the voltage and current that can be supplied from T-Engine to a daughter board. When a daughter board requires more current, a power supply must be mounted on the daughter board.

Table 9.1 Voltage and Current to the Daughter Board

Extension slot signal name	Output voltage	Permissible current	Remarks
3.3V 3.3VSB	3.3V	250mA	3.3V: Supplied when the SH7760 is turned ON. 3.3VSB: Always supplied when the AC adapter is connected.
5V	5V	250mA	Supplied when the SH7760 is turned ON.

⚠ CAUTION

When a peripheral device operating on the bus power via the USB has been connected to T-Engine or the PCMCIA card is in use, the permissible current is the current obtained by subtracting the dissipation current of the device and card from the permissible current.

9.3 Daughter Board Stack

A maximum of 2 daughter boards can be stacked. When multiple daughter boards are stacked, care should be taken for electric capacity. Figure 9.2 shows an example of daughter board stacks.

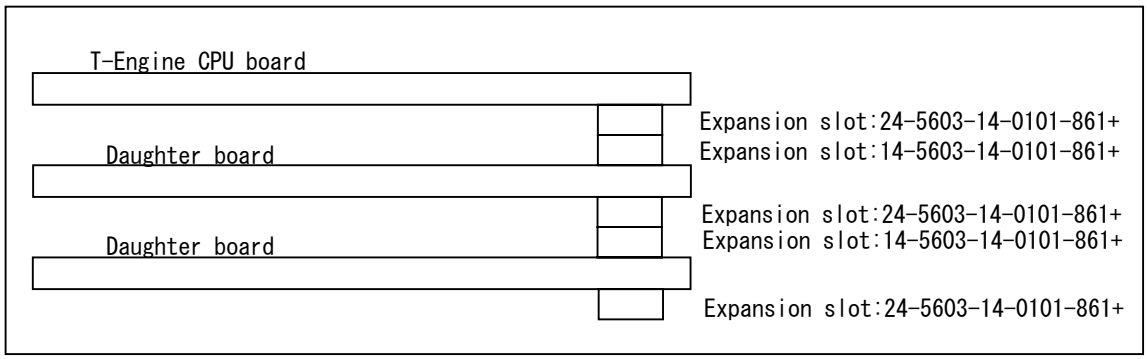

Figure 9.2 Daughter Board Stack

9.4 Daughter Board WAIT# Output

T-Engine is provided with a WAIT# input pin on the extension slot for WAIT input to the daughter board. When a WAIT# is output from the daughter board, open collector output must take place to prevent a collision of WAIT# output when multiple daughter boards are stacked.

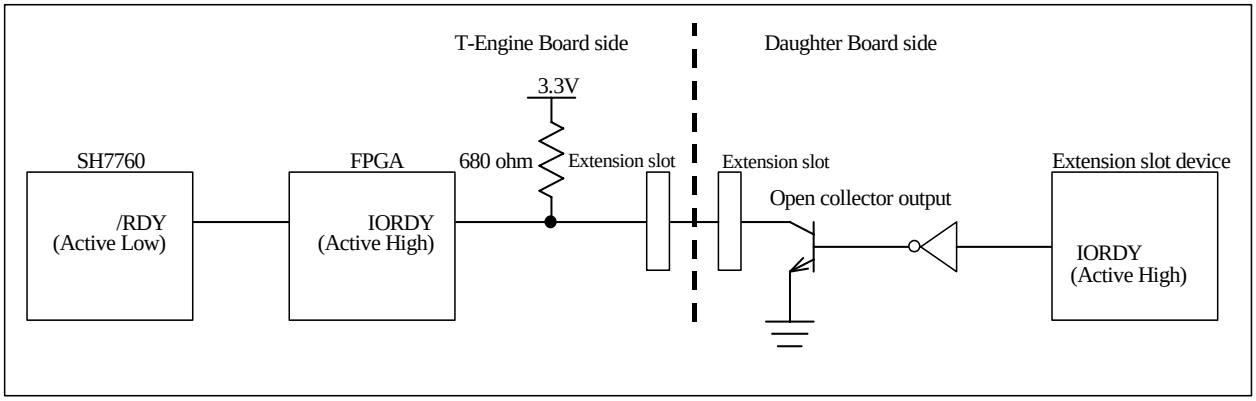

Figure 9.3 Extension Slot IORDY Pin Structure

9.5 Expansion Slot AC Timing

As shown in Figure 9.4, the SH7760 bus signal is output to the extension slot via the bus buffer. For this reason, the bus signal delays approx. 8nsec for the AC timing of the SH7760 bus. When designing the daughter board, consider this delay. Figure 9.5 shows the basic bus timing of the SH7760.

For details on SH7760 bus timing, refer to the pertinent SH7760 Hardware Manual.

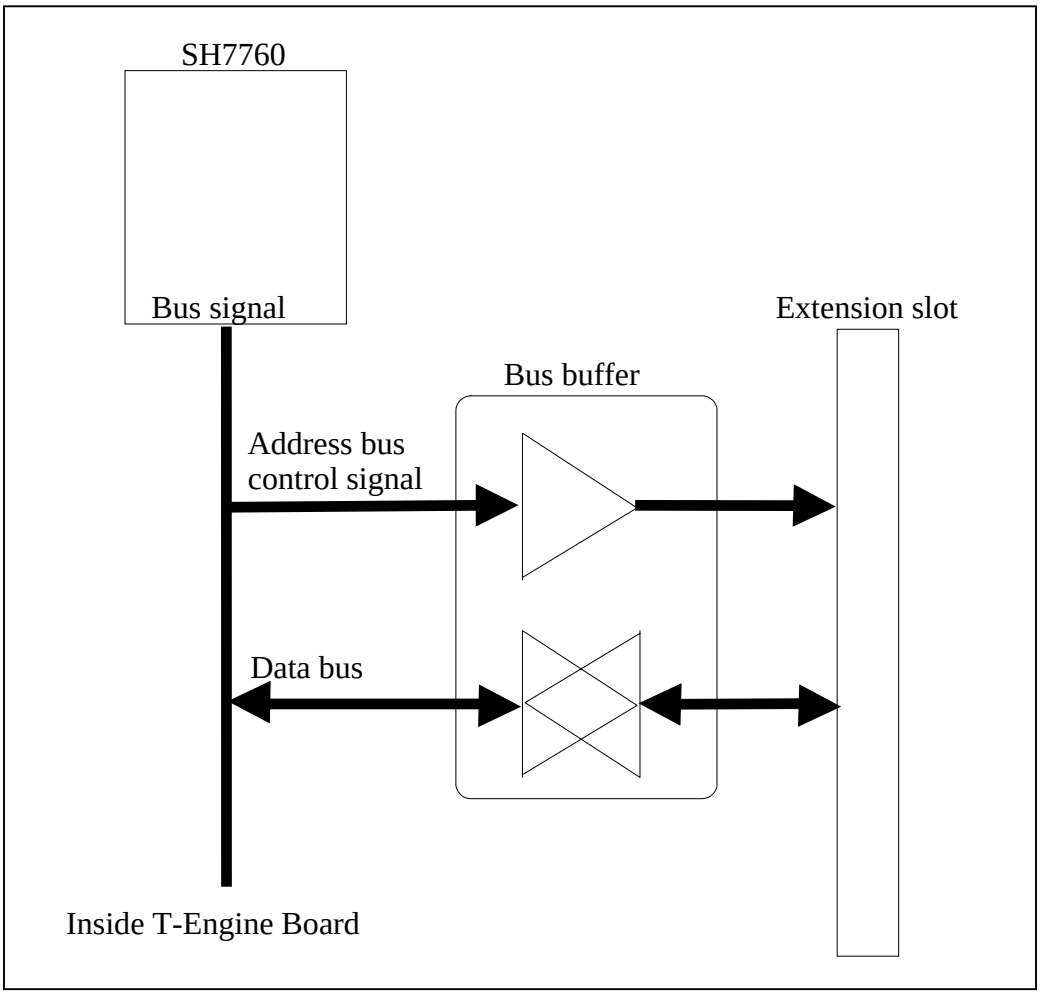

Figure 9.4 Extension Slot Bus Buffer Structure

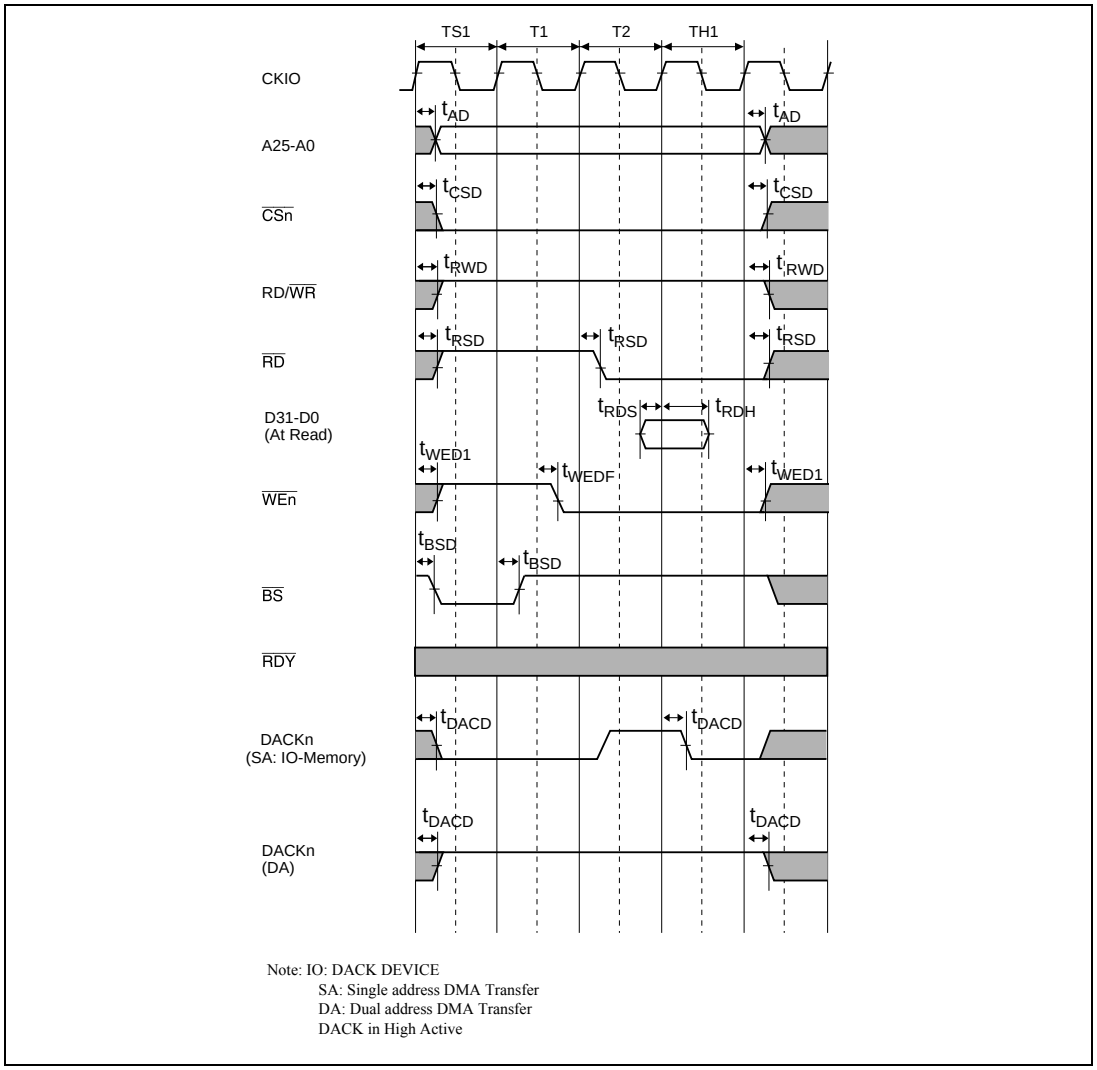
⚠ CAUTION

The bus timing delay time must be used only for reference. This is not a guaranteed value.



Note: IO: DACK DEVICE
SA: Single address DMA Transfer
DA: Dual address DMA Transfer
DACK in High Active

10. Flash Memory Refresh

When refreshing the contents of the flash memory on T-Engine or the internal flash memory of the power supply controller (H8/3048F-ONE), connect the debug board to the expansion slot of T-Engine and run the program stored in the EPROM on the debug board.

10.1 Preparation for Flash Memory Refresh

Connect the debug board to the expansion slot (CN2) of T-Engine. In addition, make the following settings for the jumper switch.

For details, refer to 2.4.2 “Debug Board Connection” and 2.4.3 “Debug Board Jumper switch.”

Debug board jumper switch (J1): Pins 1 and 2 must be short-circuited.

Connect the serial interface connector (CN1) of T-Engine and host system with an RS-232C interface cable (accessory). Start communication software on the host system and make the following settings.

Baud rate: 115200bps
Data length: 8 bits
Parity bit: None
Stop bit: 1 bit
Flow control: Xon/Xoff

After making the above settings, turn on the power of T-Engine, and the title screen --- screen indicating the execution status of the program stored in the EPROM --- will be displayed on the communication software as shown below.

[Display Screen]

```
==================================================
          SH7760 Self Debugger Ver X.XL
--------------------------------------------------------------------------------------------
==================================================

                                  H[elp] for help messages...
Ready>
```

10.2 T-Engine Flash Memory

10.2.1 Refresh Method

Figure 10.1 shows how the T-Engine flash memory is refreshed. As shown in Figure 10.1, the T-Engine flash memory is refreshed in such a way that flash memory data is copied to SDRAM and the data transferred from the host system is written to the flash memory.

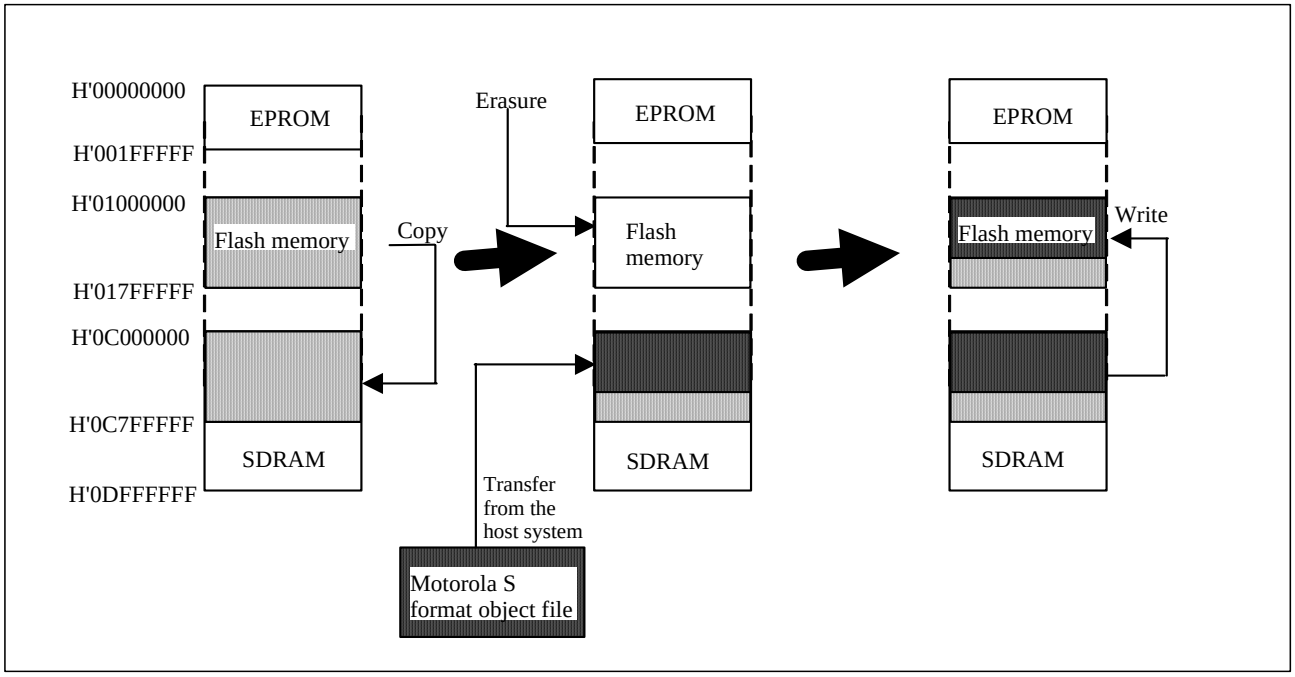

Figure 10.1 Flash Memory Refresh

Below is a description of the T-Engine flash memory refresh method.

(1) As shown on the following screen, type “FL 0” and hit the Enter key after the title screen appears on the communication software.

[Display Screen]

```
Ready >fl 0
```

(2) As shown on the following screen, transfer the Motorola S format object file after the transfer request message “Please Send A S-format Record” appears on the screen.

[Display Screen]

```
SH7760 Flash Memory Change Value!
Flash Memory data copy to RAM
Please Send A S-format Record
```

(3) Flash memory refresh normally terminates when the messages (“flash memory chip erase: complete” and “flash write complete”) sequentially appear on the screen after the Motorola S format object file has been transferred.

[Display Screen]

```
Ready >fl 0

SH7760 Flash Memory Change Value!
Flash Memory data copy to RAM
Please Send A S-format Record

Start   Addrs = A0000000
End   Addrs = A00FFFFF

Transfer complete
Flash chip erase: complete
Program :complete
Flash write complete
Ready >
```
